FINDING OF NO SIGNIFICANT IMPACT (FONSI)

The Bureau of Ocean Energy Management (BOEM) has prepared a Site-Specific Environmental Assessment (SEA) (No. S-8070) complying with the National Environmental Policy Act (NEPA). NEPA regulations under the Council on Environmental Quality (CEQ) (40 CFR §§ 1501.3 and 1501.5), the United States Department of the Interior (DOI) NEPA implementing regulations (43 CFR part 46), and BOEM policy require an evaluation of proposed major Federal actions, which under BOEM jurisdiction includes approving a plan for oil and gas exploration or development activity on the Outer Continental Shelf (OCS).

Impacts caused by similar actions to that proposed were examined at a basin-wide scale in the Gulf of Mexico (GOM) in the following NEPA and relevant documents:

- *Gulf of Mexico OCS Oil and Gas Lease Sales: 2017-2022 Gulf of Mexico Lease Sales 249, 250, 251, 252, 253, 254, 256, 257, 259, and 261 – Final Multisale Environmental Impact Statement (2017-2022 GOM Multisale EIS) (OCS EIS/EA BOEM 2017-009);*
- *Gulf of Mexico OCS Lease Sale Final Supplemental Environmental Impact Statement 2018 (2018 GOM Supplemental EIS) (OCS EIS/EA BOEM 2017-074);*
- *Biological Opinion Oil and Gas Leasing, Exploration, Development, Production, Decommissioning, and All Related Activities in the Gulf of Mexico Outer Continental Shelf (FWS 2018 BO) (Issued by United States Fish and Wildlife Service [FWS] on April 20, 2018);*
- *Biological Opinion on the Federally Regulated Oil and Gas Program Activities in the Gulf of Mexico (NMFS 2020 BO) (Issued by National Marine Fisheries Service on [NMFS] March 13, 2020);*
- *Amended Incidental Take Statement and Revised Appendices to the Programmatic Biological Opinion on the Gulf of Mexico Oil and Gas Program (Issued by NMFS on April 26, 2021);*
- *Gulf of Mexico Catastrophic Spill Event Analysis: High-Volume, Extended-Duration Oil Spill Resulting from Loss of Well Control on the Gulf of Mexico Outer Continental Shelf; 2nd Revision (Gulf of Mexico Catastrophic Spill Event Analysis) (OCS Report BOEM 2021-007); and*
- *Biological Environmental Background Report for the Gulf of Mexico OCS Region (BEBR) (OCS Report BOEM 2021-015).*

Proposed Activities: BHP Billiton Petroleum (GOM) Inc's (BHP) Supplemental Exploration Plan (EP) for drilling operations on the OCS of the GOM proposes to explore for hydrocarbons by drilling and temporarily abandoning wells J1-1 and J1-3 (J1-3 is intended as a respud/relief well) in

Green Canyon Block 564, Lease Number OCS-G 34993 in the Central Planning Area of the GOM (Proposed Action). The Proposed Action is located south of Port Fourchon, Louisiana, approximately 115 miles (185 kilometers) from the nearest Louisiana shoreline in Lafourche Parish, Louisiana. The water depth of the project area is 4,187 – 4,188 feet (ft) (1,276 – 1,277 meters [m]). BHP proposes using a dynamically positioned (DP) drillship, a mobile offshore drilling unit (MODU), to drill these wells.

Resources and Impacts Considered: The impact analysis focused on the exploration activities and the resources that may be potentially impacted. The impact producing factors (IPF) include (1) bottom disturbances, (2) waste and discharges, (3) noise, (4) vessel traffic, (5) air emissions, (6) spill and spill response, and (7) marine trash and debris.

In the Supplemental EP, (BHP) has included all required mitigation measures (e.g., lease stipulations, NMFS 2020 BO and 2021 Amended ITS terms and conditions and reasonable and prudent measures, and FWS 2018 conservation recommendations) and regulatory guidance as part of its Proposed Action. BOEM has assessed the impacts of the Proposed Action on the following resources:

- air quality;
- offshore water quality;
- benthic communities;
- marine mammals;
- sea turtles;
- fish resources and essential fish habitat (EFH);
- marine and coastal birds;
- archaeological resources;
- human/socioeconomic resources; and
- other marine uses.

Based on the site-specific analysis, the Proposed Action would result in negligible to minor impacts to marine mammals and sea turtles because the resources may be present at times or located near where activities will take place, or would be potentially impacted from proposed activities. Based on the site-specific analysis and because all required mitigation measures and regulatory guidance are incorporated into the Proposed Action, no additional mitigation measures are required at this time. As a result, in this SEA, BOEM has considered two alternatives: (1) No Action and (2) Proposed Action.

In S-8070 EP, and in accordance with lease terms and applicable regulations and guidance, BHP has committed to employ required mitigation measures to address potential impacts to air quality, water quality, benthic communities, marine mammals, sea turtles, fish resources and EFH, and archaeological resources from the Proposed Action. Therefore, BOEM has determined that any remaining impacts would have no or negligible impact, and BOEM has selected Alternative 2, Proposed Action, and will not require additional mitigation measures as conditions of approval. Below are the required mitigation measures:

- **COMPLIANCE WITH BIOLOGICAL OPINION TERMS AND CONDITIONS AND REASONABLE AND PRUDENT MEASURES:** This approval is conditioned upon compliance with the Reasonable and Prudent Measures and implementing Terms and Conditions of the Biological Opinion issued by the National Marine Fisheries Service on March 13, 2020, and the amendment issued on April 26, 2021. This includes mitigation, particularly any appendices to Terms and Conditions applicable to the plan, as well as record-keeping and reporting sufficient to allow BOEM and BSEE to comply with reporting and monitoring requirements under the BiOp; and any additional reporting required by BOEM or BSEE developed as a result of BiOp implementation. The NMFS Biological Opinion may be found here:

<https://www.fisheries.noaa.gov/resource/document/biological-opinion-federally-regulated-oil-and-gas-program-activities-gulf-mexico>.

The Appendices and protocols may be found in the amendment here:

<https://www.fisheries.noaa.gov/resource/document/appendices-biological-opinion-federally-regulated-oil-and-gas-program-gulf-mexico>.

The amendment provided updates to Appendices A, C, and I, which may be found here:

<https://repository.library.noaa.gov/view/noaa/29355>.

- **SUPPORT BASES AND VESSEL TRANSIT ROUTES:** Approval of your plan is conditioned upon your use of the support bases and vessel transit routes as described in your plan. BOEM/BSEE must be notified at least 15 days prior to any vessel route changes that require transit of the Bryde's Whale area, and you must receive prior approval for that transit from BOEM/BSEE.
- **SEISMIC SURVEY OPERATION, MONITORING, AND REPORTING GUIDELINES:** The applicant will follow the guidance provided under Appendix A: Seismic Survey Mitigation and Protected Species Observer Protocols found in the Biological Opinion issued by the National Marine Fisheries Service on April 26, 2021. The guidance can be accessed on NOAA Fisheries internet website at <https://repository.library.noaa.gov/view/noaa/29355>.

- **MARINE TRASH AND DEBRIS AWARENESS AND ELIMINATION:** The applicant will follow the protocols provided under Appendix B. Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols found in the Biological Opinion issued by the National Marine Fisheries Service on March 13, 2020. The guidance can be accessed on NOAA Fisheries internet website at <https://www.fisheries.noaa.gov/resource/document/appendices-biological-opinion-federally-regulated-oil-and-gas-program-gulf-mexico>.
- **VESSEL-STRIKE AVOIDANCE/REPORTING:** The applicant will follow the protocols provided under Appendix C. Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols found in the Biological Opinion issued by the National Marine Fisheries Service on April 26, 2021. The guidance can be accessed on the NOAA Fisheries internet site at <https://repository.library.noaa.gov/view/noaa/29355>.
- **SEA TURTLE RESUSCITATION GUIDELINES:** The applicant will follow the guidance provided under Appendix J. Sea Turtle Handling and Resuscitation Guidelines found in the Biological Opinion issued by the National Marine Fisheries Service on March 13, 2020. The guidance can be accessed on the NOAA Fisheries internet site at <https://www.fisheries.noaa.gov/resource/document/appendices-biological-opinion-federally-regulated-oil-and-gas-program-gulf-mexico>.
- **MOON POOL MONITORING CONDITION OF APPROVAL:** A moon pool has been identified during review of your plan submittal. The requirements below must be followed for any activities entailing use of the moon pool, except under circumstances when complying with these requirements would put the safety of the vessel or crew at risk. If any protected species (i.e. species protected under the Endangered Species Act [ESA] and/or Marine Mammal Protection Act [MMPA]) is detected in the moon pool, you are required to follow the appropriate procedures described in the Reporting Requirements condition of approval (COA) in your plan approval.

Application of these measures includes, but is not limited to, dive support vessels, service vessels, pipelaying vessels, drillships, floating platforms (e.g., SPAR), mobile offshore drilling units, and other facilities with enclosed moon pools (e.g., well in the hull of a vessel, with or without a door).

General Requirements

- Where the moon pools have hull doors, the operator(s) should keep the doors closed as much as reasonably practicable when no activity is occurring within the moon pool, unless the safety of crew or vessel require otherwise. This will prevent protected species from entering the confined area during periods of non-activity.
- Use of a moon pool requires regular monitoring while open to the water column and if a vessel is not underway. Regular monitoring means 24-hour video monitoring with hourly

recurring checks for at least five minutes of the video feed, or hourly recurring visual checks of the moon pool for at least five minutes by a dedicated crew observer with no other tasks during that short visual check.

- If water conditions are such that observers are unable to see within a meter of the surface, operations requiring the lowering or retrieval of equipment through the moon pool must be conducted at a rate that will minimize potential harm to protected species.

Closure of the Hull Door

- Should the moon pool have a hull door that can be closed, then prior to and following closure, the moon pool must be monitored continuously by a dedicated crew observer with no other tasks to ensure that no individual protected species is present in the moon pool area. If visibility is not clear to the hull door from above (e.g., turbidity or low light), 30 minutes of monitoring is required prior to hull door closure.
- If a protected species is observed in the moon pool prior to closure of the hull door, the hull door must not be closed, except for human safety considerations. Once the observed animal leaves the moon pool, the operator may commence closure. If the observed animal remains in the moon pool after closure, contact NMFS or BSEE prior to the closure of the hull doors according to reporting requirements (see *Reporting Requirements COA under Reporting of Observations of Protected Species within an Enclosed Moon Pool*).

Movement of the Vessel (No Hull Door) and Equipment Deployment/Retrieval

- Prior to movement of the vessel and/or deployment/retrieval of equipment, the moon pool must be monitored continuously for a minimum of 30 minutes, by a dedicated crew observer with no other tasks, to ensure no individual protected species is present in the moon pool area.
- If a protected species is observed in the moon pool prior to movement of the vessel, the vessel must not be moved and equipment must not be deployed or retrieved, except for human safety considerations. If the observed animal leaves the moon pool, the operator may commence activities. If the observed animal remains in the moon pool contact BSEE prior to planned movement of the vessel according to reporting requirements (see *Reporting Requirements COA under Reporting of Observations of Protected Species within an Enclosed Moon Pool*).
- Should a protected species be observed in a moon pool prior to activity commencement (including lowering or retrieval of equipment), recovery of the animal or other actions specific to the scenario may be required to prevent interaction with the animal. If protected species are observed during activity, only reporting is required (see *Reporting*

Requirements COA). Operators must not take such action except at the direction of, and after contact with, NMFS (see *Reporting Requirements COA*).

- **SLACK-LINE PRECAUTIONS CONDITION OF APPROVAL:** If operations require the use of flexible, small diameter (< 2 inch) lines to support operations (with or without divers), operators/contractors must reduce the slack in the lines, except for human safety considerations, to prevent accidental entanglement of protected species (i.e. species protected under the Endangered Species Act [ESA] and/or Marine Mammal Protection Act [MMPA]). This requirement includes tether lines attached to remotely operated equipment. The requirements below must be followed for any activities entailing use of flexible, small diameter lines that will not remain continuously taut, except when complying with these requirements would put the safety of divers, crew or the vessel at risk:
 - Operators must utilize tensioning tools and/or other appropriate procedures to reduce unnecessary looseness in the lines and/or potential looping;
 - The lines must remain taut, as long as additional safety risks are not created by this action;
 - A line tender must be present at all times during dive operations and must monitor the line(s) the entire time a diver is in the water; and
 - Should the line tender and/or diver become aware of an entanglement of an individual protected species, the reporting requirements described in the *Reporting Requirements COA* must be followed as soon as safety permits.

- **REPORTING REQUIREMENTS CONDITION OF APPROVAL:** Review of your proposed activities identified use of equipment that has the potential for entanglement and/or entrapment of protected species (i.e. species protected under the Endangered Species Act [ESA] and/or Marine Mammal Protection Act [MMPA]) that could be present during operations. In case of entrapment, procedures and measures for reporting are dependent upon the situation at hand. **These requirements replace those specific to dead and injured species reporting in respective sections of Appendix A (insofar as they relate to geophysical surveys) and Appendix C of the 2020 Biological Opinion on the Bureau of Ocean Energy Management's Oil and Gas Program Activities in the Gulf of Mexico.**

Incidents Requiring Immediate Reporting

Certain scenarios or incidents require immediate reporting to Federal agencies; these are described below:

Should any of the following occur at any time, **immediate reporting** of the incident is required after personnel and/or diver safety is ensured:

- Entanglement or entrapment of a protected species (i.e., an animal is entangled in a line or cannot or does not leave a moon pool of its own volition).
 - Injury of a protected species (e.g., the animal appears injured or lethargic).
 - Interaction, or contact with equipment by a protected species.
 - Any observation of a leatherback sea turtle within a moon pool (regardless of whether it appears injured, or an interaction with equipment or entanglement/entrapment is observed).
1. As soon as personnel and/or diver safety is ensured, report the incident to National Marine Fisheries Service (NMFS) by contacting the appropriate expert for 24-hr response. If you do not receive an immediate response, you must keep trying until contact is made. Any failed attempts should be documented. Contact information for reporting is as follows:
 - a. **Marine mammals:** contact **Southeast Region's Marine Mammal Stranding Hotline at 1-877-433-8299.**
 - b. **Sea turtles:** contact **Brian Stacy, Veterinary Medical Officer at 352-283-3370.** If unable to reach Brian Stacy, contact Lyndsey Howell at 301-310-3061. This includes the immediate reporting of **any observation of a leatherback sea turtle within a moon pool.**
 - c. **Other protected species** (e.g., giant manta ray, oceanic whitetip shark, or Gulf sturgeon): contact the **ESA Section 7 biologist at 301-427-8413 (nmfs.psoreview@noaa.gov)** and report all incidents to takereport.nmfsser@noaa.gov.
 - d. Minimum reporting information is described below:
 - i. Time, date, water depth, and location (latitude/longitude) of the first discovery of the animal;
 - ii. Name, type, and call sign of the vessel in which the event occurred;
 - iii. Equipment being utilized at time of observation;
 - iv. Species identification (if known) or description of the animal involved;
 - v. Approximate size of animal;
 - vi. Condition of the animal during the event and any observed injury/behavior;

- vii. Photographs or video footage of the animal, only if able; and
 - viii. General narrative and timeline describing the events that took place.
2. After the appropriate contact(s) have been made for guidance/assistance as described in 1 above, you may call BSEE at 985-722-7902 (24 hours/day) for questions or additional guidance on recovery assistance needs (if still required) and continued monitoring requirements. You may also contact this number if you do not receive a timely response from the appropriate contact(s) listed in 1. above.
- a. Minimum post-incident reporting includes all information described above (under 1.d.i-viii) in addition to the following:
 - i. NMFS liaison or stranding hotline that was contacted for assistance;
 - ii. For moon pool observations or interactions:
 - Size and location of moon pool within vessel (e.g., hull door or no hull door);
 - Whether activities in the moon pool were halted or changed upon observation of the animal; and
 - Whether the animal remains in the pool at the time of the report, or if not, the time/date the animal was last observed.

Reporting of Observations of Protected Species Within an Enclosed Moon Pool

If a protected species is observed within an enclosed moon pool and does not demonstrate any signs of distress or injury or an inability to leave the moon pool of its own volition, measures described in this section must be followed (only in cases where they do not jeopardize human safety). Although this particular situation may not require immediate assistance and reporting as described under Incidents Requiring Immediate Reporting (see above), a protected species could potentially become disoriented with their surroundings and may not be able to leave the enclosed moon pool of their own volition. In order for operations requiring use of a moon pool to continue, the following reporting measures must be followed:

Within 24 hours of any observation, and daily after that for as long as an individual protected species remains within a moon pool (i.e., in cases where an ESA listed species has entered a moon pool but entrapment or injury has not been observed), the following information must be reported to BSEE (protectedspecies@bsee.gov) and BOEM (protectedspecies@boem.gov):

1. For an initial report, all information described under 1.d.i-viii above should be included.

2. For subsequent daily reports:

- a. Describe the animal's status to include external body condition (e.g., note any injuries or noticeable features), behaviors (e.g., floating at surface, chasing fish, diving, lethargic, etc.), and movement (e.g., has the animal left the moon pool and returned on multiple occasions?);
- b. Description of current moon pool activities, if the animal is in the moon pool (e.g., drilling, preparation for demobilization, etc.);
- c. Description of planned activities in the immediate future related to vessel movement or deployment of equipment;
- d. Any additional photographs or video footage of the animal, if possible;
- e. Guidance received and followed from NMFS liaison or stranding hotline that was contacted for assistance;
- f. Whether activities in the moon pool were halted or changed upon observation of the animal; and
- g. Whether the animal remains in the pool at the time of the report, or if not, the time/date the animal was last observed.

Conclusion: BOEM has evaluated the potential environmental impacts of the Proposed Action and, based on our evaluation in this SEA, BOEM has selected Alternative 2. Based on SEA No. S-8070, a determination is made that the Proposed Action would have no significant impact on the human environment; therefore, preparation of an environmental impact statement is not required. Any new information relevant to resources was updated and analyzed in the attached SEA and the other documents listed above that were reviewed and considered by BOEM.

Site-Specific Environmental Assessment (SEA)

BHP BILLITON PETROLEUM (GOM) INC

SUPPLEMENTAL EXPLORATION PLAN: S-8070

1 INTRODUCTION

This Site-Specific Environmental Assessment (SEA) has been prepared to determine whether the proposed activities outlined in the Supplemental Exploration Plan (EP), S-8070, initially submitted by BHP Billiton Petroleum (GOM) Inc (BHP) on December 27, 2021 (Proposed Action), will significantly affect the quality of the human environment within the meaning of Section 102(2)(c) of the National Environmental Policy Act (NEPA) and therefore require an environmental impact statement (EIS) to be prepared. BHP's Supplemental EP proposes to explore for hydrocarbons by drilling and temporarily abandoning well J1-1 and J1-3 (intended as a respud/relief only) in Green Canyon Block 564, Lease Number OCS-G 34993 in the Central Planning Area (CPA) of the Gulf of Mexico (GOM).

The Council on Environmental Quality (CEQ) and the United States Department of the Interior (DOI) regulations encourage the use of existing environmental analyses (i.e., tiering) to avoid unnecessary redundant analyses, reduce the size of new NEPA documents, and focus the NEPA analysis on the issues for decision at each level of environmental review (40 CFR §§ 1501.11 and 1508.1(ff); 43 CFR § 46.140). The regulations are designed to allow for the preparation of an SEA for an individual proposed action as long as any previously unanalyzed effects are not significant. As such, this SEA is tiered to the following Bureau of Ocean Energy Management (BOEM) NEPA and relevant documents, which evaluated the potential impacts resulting from exploration and development activities across the GOM Outer Continental Shelf (OCS):

- *Gulf of Mexico OCS Oil and Gas Lease Sales: 2017-2022 Gulf of Mexico Lease Sales 249, 250, 251, 252, 253, 256, 257, 259, and 261 – Final Multisale Environmental Impact Statement (2017-2022 GOM Multisale EIS) (BOEM, 2017a);*
- *Gulf of Mexico OCS Lease Sale: Final Supplemental Environmental Impact Statement 2018 (2018 GOM Supplemental EIS) (BOEM, 2017b);*
- *Biological Opinion Oil and Gas Leasing, Exploration, Development, Production, Decommissioning, and All Related Activities in the Gulf of Mexico Outer Continental Shelf (FWS 2018 BO) (Issued by United States Fish and Wildlife Service [FWS] on April 20, 2018);*
- *Biological Opinion on the Federally Regulated Oil and Gas Program Activities in the Gulf of Mexico (NMFS 2020 BO) (Issued by National Marine Fisheries Service [NMFS] on March 13, 2020);*

- *Amended Incidental Take Statement and Revised Appendices to the Programmatic Biological Opinion on the Gulf of Mexico Oil and Gas Program* (NMFS 2021 Amended ITS) (Issued by NMFS on April 26, 2021) (NMFS, 2021a);
- *Gulf of Mexico Catastrophic Spill Event Analysis: High-Volume, Extended-Duration Oil Spill Resulting from Loss of Well Control on the Gulf of Mexico Outer Continental Shelf; 2nd Revision (Gulf of Mexico Catastrophic Spill Event Analysis)* (BOEM, 2021a); and
- *Biological Environmental Background Report for the Gulf of Mexico OCS Region* (BEBR) (BOEM, 2021b).

This SEA analyzes the potential impacts resulting from the proposed site-specific activities. Where applicable, relevant affected environment discussions and impact analyses from the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS are summarized and utilized for site-specific analysis and are incorporated by reference. Relevant new information published after the above-referenced environmental analyses is included by citation. Lease stipulations, the Outer Continental Shelf Lands Act (OCSLA), all applicable Federal, State, and local regulations (as per 30 CFR § 550.101(a)); guidance provided in all applicable Notices to Lessees and Operators (NTLs) (as per 30 CFR § 550.103); and mitigation and monitoring measures identified in this SEA, 2017-2022 GOM Multisale EIS, 2018 GOM Supplemental EIS, FWS 2018 BO, NMFS 2020 BO, and NMFS 2021 Amended ITS have been considered in the evaluation of the Proposed Action.

1.1 BACKGROUND

BOEM and the Bureau of Safety and Environmental Enforcement (BSEE) have been delegated the authority under OCSLA to manage and oversee the exploration and development of OCS oil, gas, and mineral resources while ensuring safe operations and the protection of the human environment. Working together, BOEM and BSEE manage oil and gas leases, permits, authorizations, and regulate exploration, development, production, and decommissioning. Prior to authorizing activities related to these phases, BOEM conducts resource and NEPA reviews. BOEM's Office of Leasing and Plans oversees the submittal of EPs and Development Operations Coordination Documents (DOCD) pursuant to 30 CFR part 550 subpart B.

As required by 30 CFR § 550.201, lessees and operators submit EPs and DOCDs to provide BOEM with information needed to adequately evaluate the overall potential impacts to the human environment prior to conducting activities on the lease. Submittal of an environmental impact analysis (EIA) is required in EPs under 30 CFR § 550.227 and in DOCDs under 30 CFR § 550.261; wherein, the operator provides environmental information and makes impact conclusions regarding their proposed activities.

1.2 PURPOSE OF AND NEED FOR THE PROPOSED ACTION

BHP has submitted a plan to conduct exploration activities on the OCS. The purpose of the Proposed Action is to drill and temporarily abandon 2 wells so that BHP can utilize the information to

evaluate the potential for, and develop plans for, the development and production of hydrocarbon resources on the OCS, which would contribute to the Nation's need for energy.

The need for this action is established by BOEM's responsibility under OCSLA to make OCS lands available for expeditious and orderly development, subject to environmental safeguards, in a manner that is consistent with the maintenance of competition and other national needs. Section 11 of OCSLA (43 U.S.C. § 1340) requires oil and gas lessees seeking to conduct exploration activities to first obtain approval from the Secretary who has delegated the authority to grant such approval to BOEM.

In response to the Proposed Action in BHP's plan, BOEM is required by OCSLA to approve, approve with modifications, or deny the plan within 30 days (refer to 43 U.S.C. § 1340(c)(1)). The criteria that BOEM will apply in reaching a decision to approve, approve with modifications, or deny the plan within 30 days and the scope of its discretion are provided by Section 11 of OCSLA and detailed in the implementing regulations (30 CFR part 550 subpart B). Authorizing the Proposed Action, as outlined in the Supplemental EP S-8070, allows BHP to pursue its rights under the lease and to conduct exploration drilling activities.

1.3 DESCRIPTION OF PROPOSED ACTION

BHP's Supplemental EP for drilling operations on the Gulf of Mexico OCS proposes to explore for hydrocarbons by drilling and temporarily abandoning wells J1-1 and J1-3 (J1-3 is intended as a respud/relief well) in Green Canyon Block 564, Lease Number OCS-G 34993 in the Central Planning Area of the GOM (Proposed Action). The Proposed Action is located south of Port Fourchon, Louisiana, approximately 115 miles (185 kilometers) from the nearest Louisiana shoreline in Lafourche Parish, Louisiana. The water depth of the project area is 4,187 – 4,188 feet (ft) (1,276 – 1,277 meters [m]). BHP proposes using a dynamically positioned (DP) drillship, a mobile offshore drilling unit (MODU), to drill these wells. The projected duration of the proposed drilling is 100 days per well and will begin in March 2022 and end by September 2023.

Supply and crew boat facilities to support the proposed activities are to be located in existing facilities in Port Fourchon, Louisiana, approximately 118 mi (190 km) north of the project location. Port Fourchon will be used as the debarkation point for equipment, supplies, and crews supporting the proposed activities. Air operations will be flown out of Houma, Louisiana approximately 154 mi (254 km) north of the project location. BHP does not expect any shore-based construction or expansion in association with these proposed activities. The types of support vessels and their potential travel frequency during exploratory drilling are included in BHP's plan (BHP, 2021). No new or unusual technology is proposed by BHP.

1.4 IMPACT-PRODUCING FACTORS

For purposes of this analysis, an impact-producing factor (IPF) is the outcome of a proposed activity that may pose a vulnerability risk or potential impact to the human environment, such as noise (acoustic source), air emissions, discharges and waste (effluent), or offshore habitat modification

(physical disturbance). The impact analysis evaluates the potentially affected environment¹ and the degree of the effects² of the action. Each phase of oil and gas operations typically have specific types of IPFs that may affect physical or environmental conditions and/or may affect one or more natural, cultural, or socioeconomic resource(s). The IPFs are categorized as routine activities, accidental events, and other effects that are reasonably foreseeable and have a close causal connection to the Proposed Action. Detailed descriptions of routine activities and accidental events considered in this SEA are provided in **Appendix A**, and the vulnerability (effects or impacts) of resources to IPFs is also available in the BEBR (BOEM, 2021b).

1.4.1 Routine Activities

Routine activities are generally sequential and occur on a regular basis during the lifetime of a lease (i.e., 50 years). Examples of routine activity include geological and geophysical (G&G) surveys³, drilling wells, installing production structures and/or subsea infrastructure (platforms, wellheads, manifolds, subsea tie-ins, pipelines), ancillary activities, and decommissioning. Specific to the activities for exploration proposed by BHP, the routine activities would result in the following:

- (1) bottom disturbance or offshore habitat modification;
- (2) noise;
- (3) discharges and wastes;
- (4) space-use conflicts; and
- (5) air emissions.

1.4.2 Accidental Events

Though not planned, intended, nor anticipated, BOEM recognizes that there is potential for accidental events. The impacts and complexity of an accidental event can vary greatly dependent upon the type, interrelated factors, type and amount of material, time of year, and resources impacted. The primary IPFs from potential accidents related to the proposed activities include the following:

¹ In considering the potentially affected environment, agencies should consider, as appropriate to the specific action, the affected area (national, regional, or local) and its resources, such as listed species and designated critical habitat under the Endangered Species Act (ESA). Significance varies with the setting of the proposed action (40 CFR § 1501.3(b)(1)).

² The degree of the effects, as appropriate to the specific action; both short and long term, beneficial and adverse, public health and safety, and whether the effects would violate laws protecting the environment are to be considered (40 CFR § 1501.3(b)(2)(i-iv)).

³ The G&G activities for oil and gas exploration and development are authorized on the basis of whether or not the proposed activities occur before leasing takes place (prelease) and are authorized by a permit or the G&G activity will occur on an existing lease (post-lease/ancillary). Postlease/ancillary activities are authorized by OCS plan approvals, plan revisions, requirement for notification, or a separate G&G permit if the survey will extend off the existing lease.

- (1) accidental releases (oil/chemical spills and oil spill response, emergency flaring/venting, or marine trash and debris);
- (2) accidental collisions resulting in a spill (vessel to vessel or vessel to structure);
- (3) accidental vessel strike (vessel to organism); and
- (4) accidental entanglement/entrapment (equipment or facility and organism).

1.5 ACCIDENTAL SPILL CONCERNS

Based on experience and the operations proposed in BHP's plan, the potential sources of spills from the proposed activity would include the following:

- (1) a storage tank accident on the MODU or vessel(s);
- (2) a transfer operation mishap between the supply vessel(s) and the MODU;
- (3) a leak resulting from damage to the fuel tanks or equipment on the MODU or vessel(s); and/or
- (4) a loss of well control (LWC)⁴.

As required by 30 CFR §§ 550.219 and 550.250, lessees or designated operators are required to provide BSEE and BOEM with an oil spill response plan (OSRP) that is prepared in accordance with 30 CFR part 254 subpart B with their proposed exploration, development, or production plan for the facilities that they will use to conduct their activities or to alternatively reference their approved Regional OSRP. In addition, lessees or designated operators are required to report incidents under 30 CFR § 250.188(a) (fatalities, blowouts, explosions, etc.) and oil spills pursuant to 30 CFR § 250.187(d) and 30 CFR § 254.46 (from a rig, production facility, or pipeline estimated to be more than 1 barrel [bbl] [42 gallons (gal)]). As required in 30 CFR § 254.46(a), immediate notification is required for spills from a facility, another offshore facility, or offshore spill of unknown origin.

Spill Response Requirements

Agency regulations require that all lessees and designated operators of oil handling, storage, or transportation facilities located seaward of the coastline submit an OSRP before they can operate a facility. BSEE has issued NTL 2012-N06, "Guidance to Owners and Operators of Offshore Facilities Seaward of the Coast Line Concerning Regional Oil Spill Response Plans," which informs operators of OSRP requirements and requires that they have adequate resources available to protect the

⁴ The current definition for loss of well control is as follows: uncontrolled flow of formation or other fluids (the flow may be to an exposed formation [an underground blowout] or at the surface [a surface blowout]; uncontrolled flow through a diverter; and/or uncontrolled flow resulting from a failure of surface equipment or procedures. Not all loss of well control events would result in a blowout as defined above, but they are most commonly thought of as releases to the human environment. A loss of well control can occur during any phase of development, i.e., exploratory drilling, development drilling, well completion, production, or workover operations (BOEM, 2021a).

environment from spills or releases from their facilities. The Environmental Protection and Response Plan within the OSRP outlines the availability of spill containment and cleanup equipment and trained personnel necessary to ensure that a full response can be deployed during an oil-spill emergency.

All the proposed activities and facilities in this plan will be covered by the Regional OSRP filed by BHP (OSRP Control No. O-43) (Operator Number 02010) in accordance with 30 CFR part 550 and 30 CFR part 254 and deemed in compliance by BSEE on December 13, 2021. BHP also certifies it has the capability to respond, to the maximum extent practicable, to a worst-case discharge, or a substantial threat of such a discharge, resulting from the activities proposed in their Supplemental EP (BHP, 2021).

Potential Spills from Vessels/Transfer Operations

As indicated above, offshore spills from BHP’s proposed activities are possible if an accident were to damage a storage tank onboard the drilling rig, crew boat, offshore support vessel, or fuel supply vessel. Historically, accidents of this nature have resulted from unintentional vessel collisions and transfer incidents during the offloading of diesel fuel to the drilling rig. BHP plans to use a DP drillship using a subsea blowout preventer (BOP) to conduct the proposed activities. There are several tanks onboard the MODUs that store fuel and lubricants necessary for the rig’s operation. A worst-case discharge (WCD) scenario⁵ from a rupture or spill from the vessels and other support are provided in **Table 1-1**.

Table 1-1. Worst-Case Discharges from Proposed Drillrigs and Vessels

Vessel	Largest Main Tank Capacity*	Total Capacity*
DP Drillship	628,320 gal (14,960 bbl)	2,458,260 gal (58,530 bbl)
Crew Boat	N/A	15,000 gal (357 bbls)
Supply Boat	N/A	370,000 gal (8,810 bbl)
Diesel Supply Boats	N/A	259,823 gal (6,186 bbls) 359,386 gal (8,557 bbls) 295,161 gal (7,028 bbls)
Helicopter	N/A	800 gal (19 bbls)

bbl = barrel; g = gal; N/A = not applicable.

⁵ Information provided regarding the WCD totals and calculations is not required under NEPA regulations; however, the information is included as part of the review process and compliance with 30 CFR § 254.47; BOEM NTL 2015-N01, “Information Requirements for Exploration Plans, Development and Production Plans, and Development Operations Coordination Documents on the OCS for Worst Case Discharge and Blowout Scenarios”; and Frequency Asked Questions as part of every EP and development and production plan (DPP)/DOCD. In addition, the August 16, 2010, CEQ Report prepared following the *Deepwater Horizon* explosion, oil spill, and response in the GOM recommended that BOEM should “Ensure that NEPA document provide decisionmakers with a robust analysis of reasonably foreseeable impacts, including an analysis of reasonably foreseeable impacts associated with low-probability catastrophic spills for oil and gas activities on the OCS” (CEQ, 2010). BOEM’s *Gulf of Mexico Catastrophic Spill Event Analysis* technical report is a robust analysis of the impacts from low-probability catastrophic spills and is included in this analysis to support decisionmaking purposes.

Potential Spills from a Loss of Well Control (LWC)

BSEE requires that all LWC incidents be reported immediately per 30 CFR § 250.188(a)(3). Offshore LWCs that cause large-scale, oil-spill⁶ events are rare and not expected. Most LWC accidents release a relatively small amount of oil into the environment before the well is brought under control by the operator or the well is sealed by natural processes known as bridging over⁷. It is important to note that spill volume is only one factor that influences the nature and severity of an event's impacts. Each oil-spill event is unique; its outcome depends on several factors. These factors include time of year and location, atmospheric and oceanographic conditions (e.g., winds, currents, coastal type, and sensitive resources), specifics of the well (i.e., flow rates, hydrocarbon characteristics, and infrastructure damage), and response efforts (i.e., speed and effectiveness). For these reasons, the severity of impacts from an oil spill cannot be predicted based on volume alone (BOEM, 2021a). In the event of a LWC, an operator's first course of action is to activate the BOP to close the well. The BOP may be located on the surface of the drilling rig or subsea (on the seafloor). There are built-in redundancies in the BOP system to allow activation of selected components with the intent to seal off the well bore. If a subsea BOP cannot be operated from the drill rig, it can be operated at the seafloor using remotely operated vehicles (ROVs).

BSEE prepared annual reports that described activity, environmental compliance, and safety on the OCS (<https://www.bsee.gov/newsroom/library/annual-report>)⁸. Based on records from previous years provided in the annual reports, a LWC that results in a crude oil spill is unlikely to occur. Between 2007 and 2014, on average a LWC event with a surface release occurred three times or less per year. This average is based on more than 100 wells drilled annually. As an additional measure, the operator has an OSRP in place that addresses the WCD and LWC.

Potential Site-Specific Spill Risk and Response

BHP's plan describes measures for LWC prevention, likelihood for surface intervention to stop a blowout, and early intervention in the event of a blowout. BHP has developed standards for well control, personnel safety, and an emergency response plan; these methods are stated in detail in the

⁶ As applicable to NEPA, Eccleston (2008) describes a catastrophic event as "large-scale damage involving destruction of species, ecosystems, infrastructure, or property with long-term effects, and/or major loss of human life." For oil and gas activities on the OCS, a catastrophic event is a high-volume, extended-duration oil spill regardless of the cause. The high-volume, extended-duration oil spill, or catastrophic spill, has been further defined by the National Oil and Hazardous Substances Pollution Contingency Plans as a "spill of national significance" or "a spill which, because of its severity, size, location, actual or potential impact on the public health and welfare or the environment, or the necessary response effort, is so complex that it requires extraordinary coordination of Federal, State, and local, and responsible party resources to contain and cleanup the discharge" (40 CFR part 300, Appendix E) (BOEM, 2021a).

⁷ In a LWC or blowout, the flow duration is dependent on the oil reservoir characteristics and the tendency for the well to fill in or bridge naturally (bridge over), and the timing of the intervention. The flow of a blowout well could, and often does, change as the blowout naturally bridges, the reservoir is depleted, or the reservoir pressure is reduced (Buchholz et al., 2016).

⁸ The 2014 Annual Report was based on a calendar year. The 2015 Annual Report and future reports were based on U.S. fiscal year (FY), which runs from October 1 to September 30 (BSEE, 2016). The last Annual Report available is from FY 2016.

OSRP or emergency response plan submitted by BHP (BHP, 2021). As per the information provided in BHP's OSRP plan, the MODU that BHP plans to use will deploy a subsea BOP while drilling the well (BHP, 2021).

The WCD from drilling or production operations of a subsea well is the daily rate of uncontrolled flow of natural gas or oil into the open wellbore. Operators must submit WCD calculated volumes and associated data according to NTL 2015-N01, "Information Requirements for Exploration Plans, Development and Production Plans, and Development Operations Coordination Documents on the OCS for Worst Case Discharge and Blowout Scenarios," as part of every EP and DOCD. Though not proposed or expected, BHP has estimated that a WCD scenario from a blowout of one of the wells under the proposed activities could be 269,263 barrels of oil per day (BOPD) of 31° American Petroleum Institute (API) gravity crude. In accordance with enhanced agency oversight, BOEM verified the operator's calculations used to determine the WCD volume⁹.

BHP indicated in its plan that it is assumed that the well will not bridge over and will continue to flow until the well is either capped by subsea containment devices or is killed via a relief well. Due to the complex nature of the flux calculation and mechanical earth modeling, BHP considers that it is not possible to predict with certainty if the open hole section will collapse and bridge off. BHP has developed standards for well control, personnel safety, and emergency response. These methods are stated in detail in S-8070 and OSRP O-43 (BHP, 2021).

In the event that a relief well is required due to a blowout, BHP indicates that they have six drilling rigs under contract currently in the GOM that have the capability to drill the relief well if needed (BHP, 2021). For this project, BHP estimates that it will take 7 to 10 days for the MODU to safely suspend ongoing operations and arrive at the relief well location. Upon arrival at relief well location, approximately 90 days will be required to drill the relief well and perform kill operations; for a total of up to 100 to kill the well. Also, there are no existing facilities/platforms nearby from where the relief well can be drilled. Additional details related to the proposed activities can be found in BHP's proposed Supplemental EP (BHP, 2021).

Oil-Spill Risk and Assessment

In the event of a spill, there is no single method of containing and removing the oil that would be 100 percent effective. Removal and containment efforts to respond to an ongoing spill would likely require multiple technologies, including mechanical cleanup, chemical dispersant application, and less frequently, in-situ burning of the slick. Even with the potential to deploy all of these technologies, it is likely that, with the operating limitations of today's spill response technology, not all of the oil could be contained and removed from the offshore environment. It is likely that larger spills in deep waters and

⁹ Information provided regarding the WCD totals and calculations is not required under NEPA regulations; however, the information is included as part of the review process and compliance with 30 CFR § 254.47; NLT 2015-N01, "Information Requirements for Exploration Plans, Development and Production Plans, and Development Operations Coordination Documents on the OCS for Worst Case Discharge and Blowout Scenarios"; and Frequency Asked Questions as part of every EP and DPP/DOCD.

under the right conditions would require the simultaneous use of all available cleanup methods (i.e., mechanical cleanup, dispersant application, and in-situ burning).

That being said, when considering the historical/statistical data, subsea containment improvements, BOEM and BSEE's enhanced oversight, and industry's heightened safety awareness since the *Deepwater Horizon*, it is reasonable to conclude that an accidental spill event is less likely to occur. Events that are statistically unexpected to occur, but would still be possible, such as a catastrophic discharge event are not considered a part of the proposed activities and, therefore, are not discussed in this document. For more information on a low-probability catastrophic event and the resulting analysis of potential effects, refer to BOEM's *Gulf of Mexico Catastrophic Spill Event Analysis* technical report (BOEM, 2021a).

2 ALTERNATIVES CONSIDERED

2.1 NO ACTION

Alternative 1 – If selected, BHP would not be authorized to undertake the proposed activities. If the proposed activities are not undertaken, they would not cause activity-specific routine or accidental impacts. Activities related to the previously issued authorizations on the existing OCS lease block, Green Canyon Block 564, and related to the overall OCS activities would not increase. The No Action Alternative would not significantly change the environmental impacts of overall OCS oil and gas exploration and development activities as described in the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS. Routine and accidental impacts elsewhere in the GOM and previously authorized or permitted activities on this lease block would continue to occur.

2.2 PROPOSED ACTION

Alternative 2 – If selected, BHP would be authorized to undertake the proposed activities as requested in S-8070. The lessee/operator will conduct operations in accordance with the lease stipulations; OCSLA; and all applicable Federal, State, and local regulations (as per 30 CFR § 550.101(a)); guidance provided in all appropriate NTLs (as per 30 CFR § 550.103); and appropriate mitigation measures, terms and conditions, and reasonable and prudent measures set out in the FWS 2018 BO, NMFS 2020 BO (as amended), and NMFS 2021 Amended ITS, as applicable. These consist of the following:

- **COMPLIANCE WITH BIOLOGICAL OPINION TERMS AND CONDITIONS AND REASONABLE AND PRUDENT MEASURES:** This approval is conditioned upon compliance with the Reasonable and Prudent Measures and implementing Terms and Conditions of the Biological Opinion issued by the National Marine Fisheries Service on March 13, 2020, and the amendment issued on April 26, 2021. This includes mitigation, particularly any appendices to Terms and Conditions applicable to the plan, as well as record-keeping and reporting sufficient to allow BOEM and BSEE to comply with reporting and monitoring requirements under the BiOp; and any additional reporting required by BOEM or BSEE developed as a result of BiOp implementation. The NMFS Biological Opinion may be found here:

<https://www.fisheries.noaa.gov/resource/document/biological-opinion-federally-regulated-oil-and-gas-program-activities-gulf-mexico>.

The Appendices and protocols may be found in the amendment here:

<https://www.fisheries.noaa.gov/resource/document/appendices-biological-opinion-federally-regulated-oil-and-gas-program-gulf-mexico>.

The amendment provided updates to Appendices A, C, and I, which may be found here:

<https://repository.library.noaa.gov/view/noaa/29355>.

- **SUPPORT BASES AND VESSEL TRANSIT ROUTES:** Approval of your plan is conditioned upon your use of the support bases and vessel transit routes as described in your plan. BOEM/BSEE must be notified at least 15 days prior to any vessel route changes that require transit of the Bryde's Whale area, and you must receive prior approval for that transit from BOEM/BSEE.
- **SEISMIC SURVEY OPERATION, MONITORING, AND REPORTING GUIDELINES:** The applicant will follow the guidance provided under Appendix A: Seismic Survey Mitigation and Protected Species Observer Protocols found in the Biological Opinion issued by the National Marine Fisheries Service on April 26, 2021. The guidance can be accessed on NOAA Fisheries internet website at <https://repository.library.noaa.gov/view/noaa/29355>.
- **MARINE TRASH AND DEBRIS AWARENESS AND ELIMINATION:** The applicant will follow the protocols provided under Appendix B. Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols found in the Biological Opinion issued by the National Marine Fisheries Service on March 13, 2020. The guidance can be accessed on NOAA Fisheries internet website at <https://www.fisheries.noaa.gov/resource/document/appendices-biological-opinion-federally-regulated-oil-and-gas-program-gulf-mexico>.
- **VESSEL-STRIKE AVOIDANCE/REPORTING:** The applicant will follow the protocols provided under Appendix C. Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols found in the Biological Opinion issued by the National Marine Fisheries Service on April 26, 2021. The guidance can be accessed on the NOAA Fisheries internet site at <https://repository.library.noaa.gov/view/noaa/29355>.
- **SEA TURTLE RESUSCITATION GUIDELINES:** The applicant will follow the guidance provided under Appendix J. Sea Turtle Handling and Resuscitation Guidelines found in the Biological Opinion issued by the National Marine Fisheries Service on March 13, 2020. The guidance can be accessed on the NOAA Fisheries internet site at <https://www.fisheries.noaa.gov/resource/document/appendices-biological-opinion-federally-regulated-oil-and-gas-program-gulf-mexico>.
- **MOON POOL MONITORING CONDITION OF APPROVAL:** A moon pool has been identified during review of your plan submittal. The requirements below must be followed for any activities entailing use of the moon pool, except under circumstances when complying with these requirements would put the safety of the vessel or crew at risk. If any protected species (i.e. species protected under the Endangered Species Act [ESA] and/or Marine Mammal Protection Act [MMPA]) is detected in the moon pool, you are required to follow the appropriate procedures described in the Reporting Requirements condition of approval (COA) in your plan approval.

Application of these measures includes, but is not limited to, dive support vessels, service vessels, pipelaying vessels, drillships, floating platforms (e.g., SPAR), mobile offshore drilling units, and other facilities with enclosed moon pools (e.g., well in the hull of a vessel, with or without a door).

General Requirements

- Where the moon pools have hull doors, the operator(s) should keep the doors closed as much as reasonably practicable when no activity is occurring within the moon pool, unless the safety of crew or vessel require otherwise. This will prevent protected species from entering the confined area during periods of non-activity.
- Use of a moon pool requires regular monitoring while open to the water column and if a vessel is not underway. Regular monitoring means 24-hour video monitoring with hourly recurring checks for at least five minutes of the video feed, or hourly recurring visual checks of the moon pool for at least five minutes by a dedicated crew observer with no other tasks during that short visual check.
- If water conditions are such that observers are unable to see within a meter of the surface, operations requiring the lowering or retrieval of equipment through the moon pool must be conducted at a rate that will minimize potential harm to protected species.

Closure of the Hull Door

- Should the moon pool have a hull door that can be closed, then prior to and following closure, the moon pool must be monitored continuously by a dedicated crew observer with no other tasks to ensure that no individual protected species is present in the moon pool area. If visibility is not clear to the hull door from above (e.g., turbidity or low light), 30 minutes of monitoring is required prior to hull door closure.
- If a protected species is observed in the moon pool prior to closure of the hull door, the hull door must not be closed, except for human safety considerations. Once the observed animal leaves the moon pool, the operator may commence closure. If the observed animal remains in the moon pool after closure, contact NMFS or BSEE prior to the closure of the hull doors according to reporting requirements (see *Reporting Requirements COA under Reporting of Observations of Protected Species within an Enclosed Moon Pool*).

Movement of the Vessel (No Hull Door) and Equipment Deployment/Retrieval

- Prior to movement of the vessel and/or deployment/retrieval of equipment, the moon pool must be monitored continuously for a minimum of 30 minutes, by a dedicated crew

observer with no other tasks, to ensure no individual protected species is present in the moon pool area.

- If a protected species is observed in the moon pool prior to movement of the vessel, the vessel must not be moved and equipment must not be deployed or retrieved, except for human safety considerations. If the observed animal leaves the moon pool, the operator may commence activities. If the observed animal remains in the moon pool contact BSEE prior to planned movement of the vessel according to reporting requirements (see *Reporting Requirements COA* under *Reporting of Observations of Protected Species within an Enclosed Moon Pool*).
- Should a protected species be observed in a moon pool prior to activity commencement (including lowering or retrieval of equipment), recovery of the animal or other actions specific to the scenario may be required to prevent interaction with the animal. If protected species are observed during activity, only reporting is required (see *Reporting Requirements COA*). Operators must not take such action except at the direction of, and after contact with, NMFS (see *Reporting Requirements COA*).
- **SLACK-LINE PRECAUTIONS CONDITION OF APPROVAL:** If operations require the use of flexible, small diameter (< 2 inch) lines to support operations (with or without divers), operators/contractors must reduce the slack in the lines, except for human safety considerations, to prevent accidental entanglement of protected species (i.e. species protected under the Endangered Species Act [ESA] and/or Marine Mammal Protection Act [MMPA]). This requirement includes tether lines attached to remotely operated equipment. The requirements below must be followed for any activities entailing use of flexible, small diameter lines that will not remain continuously taut, except when complying with these requirements would put the safety of divers, crew or the vessel at risk:
 - Operators must utilize tensioning tools and/or other appropriate procedures to reduce unnecessary looseness in the lines and/or potential looping;
 - The lines must remain taut, as long as additional safety risks are not created by this action;
 - A line tender must be present at all times during dive operations and must monitor the line(s) the entire time a diver is in the water; and
 - Should the line tender and/or diver become aware of an entanglement of an individual protected species, the reporting requirements described in the *Reporting Requirements COA* must be followed as soon as safety permits.
- **REPORTING REQUIREMENTS CONDITION OF APPROVAL:** Review of your proposed activities identified use of equipment that has the potential for entanglement and/or entrapment

of protected species (i.e. species protected under the Endangered Species Act [ESA] and/or Marine Mammal Protection Act [MMPA]) that could be present during operations. In case of entrapment, procedures and measures for reporting are dependent upon the situation at hand. **These requirements replace those specific to dead and injured species reporting in respective sections of Appendix A (insofar as they relate to geophysical surveys) and Appendix C of the 2020 Biological Opinion on the Bureau of Ocean Energy Management's Oil and Gas Program Activities in the Gulf of Mexico.**

Incidents Requiring Immediate Reporting

Certain scenarios or incidents require immediate reporting to Federal agencies; these are described below:

Should any of the following occur at any time, **immediate reporting** of the incident is required after personnel and/or diver safety is ensured:

- Entanglement or entrapment of a protected species (i.e., an animal is entangled in a line or cannot or does not leave a moon pool of its own volition).
 - Injury of a protected species (e.g., the animal appears injured or lethargic).
 - Interaction, or contact with equipment by a protected species.
 - Any observation of a leatherback sea turtle within a moon pool (regardless of whether it appears injured, or an interaction with equipment or entanglement/entrapment is observed).
3. As soon as personnel and/or diver safety is ensured, report the incident to National Marine Fisheries Service (NMFS) by contacting the appropriate expert for 24-hr response. If you do not receive an immediate response, you must keep trying until contact is made. Any failed attempts should be documented. Contact information for reporting is as follows:
- e. **Marine mammals:** contact **Southeast Region's Marine Mammal Stranding Hotline at 1-877-433-8299.**
 - f. **Sea turtles:** contact **Brian Stacy, Veterinary Medical Officer at 352-283-3370.** If unable to reach Brian Stacy, contact Lyndsey Howell at 301-310-3061. This includes the immediate reporting of **any observation of a leatherback sea turtle within a moon pool.**
 - g. **Other protected species** (e.g., giant manta ray, oceanic whitetip shark, or Gulf sturgeon): contact the **ESA Section 7 biologist at 301-427-8413**

(nmfs.psoreview@noaa.gov) and report all incidents to takereport.nmfsser@noaa.gov.

- h. Minimum reporting information is described below:
 - ix. Time, date, water depth, and location (latitude/longitude) of the first discovery of the animal;
 - x. Name, type, and call sign of the vessel in which the event occurred;
 - xi. Equipment being utilized at time of observation;
 - xii. Species identification (if known) or description of the animal involved;
 - xiii. Approximate size of animal;
 - xiv. Condition of the animal during the event and any observed injury/behavior;
 - xv. Photographs or video footage of the animal, only if able; and
 - xvi. General narrative and timeline describing the events that took place.
4. After the appropriate contact(s) have been made for guidance/assistance as described in 1 above, you may call BSEE at 985-722-7902 (24 hours/day) for questions or additional guidance on recovery assistance needs (if still required) and continued monitoring requirements. You may also contact this number if you do not receive a timely response from the appropriate contact(s) listed in 1. above.
 - b. Minimum post-incident reporting includes all information described above (under 1.d.i-viii) in addition to the following:
 - iii. NMFS liaison or stranding hotline that was contacted for assistance;
 - iv. For moon pool observations or interactions:
 - Size and location of moon pool within vessel (e.g., hull door or no hull door);
 - Whether activities in the moon pool were halted or changed upon observation of the animal; and
 - Whether the animal remains in the pool at the time of the report, or if not, the time/date the animal was last observed.

Reporting of Observations of Protected Species Within an Enclosed Moon Pool

If a protected species is observed within an enclosed moon pool and does not demonstrate any signs of distress or injury or an inability to leave the moon pool of its own volition, measures described in this section must be followed (only in cases where they do not jeopardize human safety). Although this particular situation may not require immediate assistance and reporting as described under Incidents Requiring Immediate Reporting (see above), a protected species could potentially become disoriented with their surroundings and may not be able to leave the enclosed moon pool of their own volition. In order for operations requiring use of a moon pool to continue, the following reporting measures must be followed:

Within 24 hours of any observation, and daily after that for as long as an individual protected species remains within a moon pool (i.e., in cases where an ESA listed species has entered a moon pool but entrapment or injury has not been observed), the following information must be reported to BSEE (protectedspecies@bsee.gov) and BOEM (protectedspecies@boem.gov):

3. For an initial report, all information described under 1.d.i-viii above should be included.
4. For subsequent daily reports:
 - h. Describe the animal's status to include external body condition (e.g., note any injuries or noticeable features), behaviors (e.g., floating at surface, chasing fish, diving, lethargic, etc.), and movement (e.g., has the animal left the moon pool and returned on multiple occasions?);
 - i. Description of current moon pool activities, if the animal is in the moon pool (e.g., drilling, preparation for demobilization, etc.);
 - j. Description of planned activities in the immediate future related to vessel movement or deployment of equipment;
 - k. Any additional photographs or video footage of the animal, if possible;
 - l. Guidance received and followed from NMFS liaison or stranding hotline that was contacted for assistance;
 - m. Whether activities in the moon pool were halted or changed upon observation of the animal; and
 - n. Whether the animal remains in the pool at the time of the report, or if not, the time/date the animal was last observed.

2.3 SUMMARY AND COMPARISON OF THE ALTERNATIVES

If selected, Alternative 1, No Action Alternative, would result in BHP not exercising its rights under the lease and conducting the proposed activities. Alternative 1 would not result in any immediate activity-specific impacts to the human environment, and the lessee may not develop or continue to develop the oil and gas resources of its lease. Alternative 1 does not meet the underlying purpose and need as defined in **Chapter 1.2** because the potential oil and gas resources at this site would not be explored or would not be further explored and, thus, may not be developed.

Alternative 2 would result in the lessee/designated operator being authorized to conduct proposed activities. Alternative 2 is BOEM's preferred alternative as it allows the lessee to achieve its exploration objectives and incorporates mitigation and monitoring requirements (as components of project design) to minimize or negate potential environmental impacts. **Table 2-1** provides an overall summary of impacts to resources.

Table 2-1. Summary of Alternatives and Potential Impacts to Resources

Resource	Alternative 1: No Action	Alternative 2: Proposed Action	Alternative 3: Proposed Action with Additional Mitigation Measures
Air Quality	Negligible	Negligible to Minor	
Water Quality	None	Negligible to Minor	
Marine Mammals	None	Negligible	
Sea Turtles	None	Negligible to Minor	
Birds	None	Negligible	
Fish and EFH	None	Negligible to Minor	
Benthic Communities	None	Negligible to Minor	
Archaeology	None	Negligible to Minor	

Negligible No impact or impacts may or may not cause observable changes to natural conditions; does not reduce the integrity of a resource.

Minor Impacts cause observable and short-term changes to natural conditions but does not reduce the integrity of a resource.

Moderate Impacts cause observable and short-term changes to natural conditions and/or reduces the integrity of a resource.

Major Impacts cause observable and long-term changes to natural conditions and reduces the integrity of a resource.

NOTE: The descriptions above are a general summary/definition of the overall impacts. Refer to each specific resource in **Chapter 3** for a more detailed definition of the impact levels used for our evaluation of the potential impacts to resources.

3 AFFECTED ENVIRONMENT AND ENVIRONMENTAL IMPACTS

3.1 INTRODUCTION

The discussion below will briefly describe/summarize the pertinent affected resources, discuss the site-specific review that was conducted, and provide the analysis of the proposed activities' potential impacts to the human environment. The description of the affected environment and impact analysis are presented together in this chapter for each resource. For the impact analysis, resource-specific significance criteria was developed for each resource category (refer to 40 CFR § 1508.1(g)).

A detailed description of resources in the GOM, along with a detailed impact analysis of the routine and accidental impacts of the proposed activities on these resources, can be found in the BEBR, GOM CSEA, and Chapter 4 of the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS, and these documents are incorporated by reference for all resources discussed below. Throughout this SEA, where information was incomplete or unavailable, BOEM complied with its obligations under NEPA to determine if the information was relevant to reasonably foreseeable significant adverse impacts; if so, whether it was essential to a reasoned choice among alternatives and, if it was essential, whether it could be obtained and whether the cost of obtaining the information is exorbitant, as well as whether scientifically credible information using generally accepted scientific methodologies could be applied in its place (40 CFR § 1502.21).

The most notable incomplete or unavailable information relates to some aspects of the effects from the *Deepwater Horizon* explosion, oil spill, and response in 2010. Credible scientific data regarding the potential short-term and long-term impacts from the *Deepwater Horizon* explosion, oil spill, and response on some GOM resources have become available. However, some long-term effects continue to be studied and results remain incomplete at this time, and it could be many years before this information becomes available. BOEM will continue to monitor these resources for effects caused by the *Deepwater Horizon* explosion, oil spill, and response, and will ensure that future BOEM environmental reviews take into account any new information that may emerge.

While incomplete or unavailable information could conceivably result in potential shifts in baseline conditions of habitats that could affect BOEM's decision-making, BOEM has determined that it can make an informed decision at this time without this incomplete or unavailable information. BOEM's subject-matter experts have applied other scientifically credible information using accepted theoretical approaches and research methods, such as information on related or surrogate species.

3.1.1 Potentially Affected Resources

Preliminary screening for this assessment was based on a review of the relevant literature, previous SEAs, 2017-2022 GOM Multisale EIS, 2018 GOM Supplemental EIS, and statistics/data pertinent to historic and projected activities. For this SEA, BOEM evaluated the site-specific impacts that may result from the operator's proposed activities and identified the following potentially affected resources:

- air quality;
- offshore water quality;
- benthic communities;
- marine mammals (including ESA listed and non-listed species);
- sea turtles (all are ESA listed species);
- fisheries and essential fish habitat (EFH);
- marine and coastal birds;
- archaeological resources;
- human/socioeconomic resources; and
- other marine uses (military, significant sand source block [SSRA], artificial reef, etc.).

3.1.2 Resources Not Affected or Negligibly Impacted

Based on the site-specific review and impact conclusions reached, the following resources below are scoped out of this SEA on the basis that the Proposed Action would not have an impact on the resource because the resource is not present within the proposed activity area and/or the proposed activities would have no impact/effect or no more than a negligible impact (**Table 3-1**).

Table 3-1. Resources Not Included for Further Analysis

Resource	Reason For No Further Analysis
Offshore Water Quality	
<p>BOEM requires projected waste and discharge information for specific proposed activities to be submitted in an exploration plan, as outlined by NTL 2008-G04. The U.S. Environmental Protection Agency (USEPA) Regions 4 and 6 regulate the discharge of routine operational waste streams generated from offshore oil- and gas-related activities. Section 403 of the Clean Water Act (CWA) requires that National Pollutant Discharge Elimination System (NPDES) permits be issued for discharges to the ocean in compliance with USEPA's regulations for preventing unreasonable degradation of the receiving waters. The NPDES permits specify effluent limitations and monitoring requirements for discharges associated with offshore oil and gas extraction activities. There are two general NPDES permits that cover the GOM. Permit GMG290000, issued by USEPA Region 6, covers the Western Planning Area (WPA) and CPA; Permit GEG460000, issued by USEPA Region 4, covers the Eastern Planning Area (EPA) and a</p>	<p>The proposed exploration activities are located within USEPA Region 6 on Green Canyon Block 564, which is located approximately 115 mi (185 km) from the nearest coastline off Lafourche Parish, Louisiana. Green Canyon Block 564 is within USEPA Region 6 and falls under the requirements of NPDES Permit GMG290000. Discharges authorized under the NPDES permit would have no effect to negligible impact on the pH, temperature, dissolved oxygen content, salinity, oxidation-reduction potential, or turbidity of the water. Furthermore, any hydrocarbons present in discharges that meet the NPDES permit would be below concentrations that would produce physical or chemical changes to water quality. In addition to permitted discharges, unpermitted spills may occur. BOEM has previously estimated that most accidental spills will be less than 50 bbl in volume, based on historical spill rates and projected OCS activity. Potential impacts on resources from these small spills would be rendered negligible by natural</p>

Resource	Reason For No Further Analysis
<p>small part of the CPA. BSEE has regulatory authority through 30 CFR part 300 to prevent and control water pollution. BSEE's Office of Environmental Compliance performs inspections to support the USEPA.</p>	<p>processes such as weathering and dispersion that would degrade the spill products. Water quality is also degraded by trash and debris. Activities proposed will comply with Federal regulations and the requirements in NMFS 2020 BO Appendix B: "Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols" to reduce the potential for trash and marine debris from the proposed activities, which reduces the potential impacts to negligible.</p>
Benthic Communities	
<p>Benthic fauna inhabit the seafloor throughout the GOM at all water depths. In deep water (>984 ft [300 m]), chemosynthetic communities form around natural hydrocarbon seepages. Deepwater coral communities can co-occur on hard substrates near hydrocarbon seeps with chemosynthetic organisms and routinely colonize other hard substrates.</p>	<p>Based on review of the geo-hazard survey and BOEM June 2019 database of 3D seismic water bottom anomalies, no known or mapped benthic resources were identified within the proposed activity area; therefore, with existing regulatory requirements in place, the potential impact is negligible and no additional mitigation or monitoring measures are applied. Activities proposed will comply with Federal, State, and local regulations and NTLs to reduce the risk for potential for accidental events; therefore, potential impacts to benthic communities from accidental events are negligible.</p>
Archaeological Resources	
<p>BOEM is required under 36 CFR § 800.4(b)(1) to make a reasonable and good faith effort to carry out appropriate identification efforts, which may include background research, consultation, oral history interviews, sample field investigation, and field survey. BOEM regulation 30 CFR § 550.194(a) requires an operator to submit an archaeological report analyzing the potential for an undertaking to adversely effect an archaeological resource where the Regional Director has reason to believe an archaeological resource may be affected by the Proposed Action. The Regional Director may then require an archaeological report. To mitigate adverse impacts to these resources, BOEM requires that the operator either avoid the features identified as possible resources in the operator's archaeological report or establish to the satisfaction of the Regional Director that an archaeological resource does not exist or will not be adversely affected by operations. Mitigation of adverse impacts to archaeological resources determined to be significant under 36 CFR § 60.4 within the identified Area of Potential Effect may be determined following consultation with the Advisory Council on Historic Preservation and appropriate State Historic Preservation Offices per</p>	<p>Based on review of the archaeological report and additional data, no archaeological resources are known to occur within the Proposed Action area. Therefore, with existing regulatory requirements in place, the potential impact is negligible and no additional mitigation or monitoring measures are applied.</p>

Resource	Reason For No Further Analysis
36 CFR § 800.6 ¹⁰ . Under 30 CFR § 550.194(c) lessees are required to immediately notify BOEM's Regional Director of the discovery of any potential archaeological resources.	
Fish and Invertebrate Resources and Essential Fish Habitat	
Fish and invertebrate resources refers to all estuarine and marine fish and invertebrates endemic to the GOM, with a particular emphasis on species of ecological and economical significance. Essential fish habitat (EFH) refers to all waters and substrate necessary for spawning, breeding, feeding, and growth to maturity for federally managed fisheries species in the GOM (16 U.S.C. §§ 1801 <i>et seq.</i>).	The proposed activities in Green Canyon Block 564 will not occur within delineated EFH and will not occur within specified distances of topographic and live bottom features that would trigger a project-specific EFH consultation as described in NTL-2009-G39. Minimum distance requirements were cooperatively developed by BOEM and NMFS during past programmatic EFH consultations for bottom-disturbing activities occurring near sensitive benthic habitats. Overall, S-8070 is expected to have negligible population-level impacts to fish and invertebrate resources in the OCS, as well as EFH due to the localized, short-term nature of the proposed activities. Therefore, no site-specific avoidances or mitigations are applied.
Marine and Coastal Birds	
Birds from six distinct taxonomic and ecological groups rely heavily on the marine (i.e., pelagic waters) and coastal habitats found in the GOM region. Species abundance in the GOM varies by season due to migration and breeding timings. Abundance can also be driven by mesoscale features, such as the Mississippi River freshwater plumes and oceanic fronts and eddies. As such, seabirds' population levels can be impacted by natural climate cycles and human activities. Currently, there are seven ESA-listed bird species in the GOM: Cape Sable seaside sparrow (<i>Federal Register</i> , 1967); Mississippi sandhill crane (<i>Federal Register</i> , 1973); piping plover (<i>Federal Register</i> , 1985); red knot (<i>Federal Register</i> , 2014a); roseate tern (<i>Federal Register</i> , 1987); whooping crane (<i>Federal Register</i> , 2011); and wood stork (<i>Federal Register</i> , 2012).	Impacts from routine activities to coastal, marine, and migratory birds include impacts from routine discharges and wastes and noise. Routine discharges and wastes affecting air and water quality are under the jurisdiction of USEPA (including NPDES) or BOEM, and existing regulations assure that impacts on birds are negligible. Birds are known to habituate to noises, including vessel traffic associated with routine commercial traffic in the Gulf of Mexico. Therefore, the impact of noise from OCS oil- and gas-related activities, such as helicopters and vessels, to birds is expected to be negligible. The FWS 2018 BO found that proposed oil and gas activities are not likely to adversely affect ESA-listed species because activities are either not expected to extend into suitable habitat, there would be no direct habitat loss, and/or the potential for an oil spill reaching specific habitat areas is low because a catastrophic spill is not reasonably certain to occur. For species that may be affected, sublethal impacts were considered discountable or insignificant effects. The FWS 2018 BO provided conservation recommendations, such as to follow altitude

¹⁰ The technical requirements of the archaeological resource survey and report are detailed in NTL 2005-G07, "Archaeological Resource Surveys and Reports"; NTL 2011-JOINT-G01, "Revisions to the List of OCS Lease Blocks Requiring Archaeological Resource Surveys and Reports"; and Pre-Seabed Disturbance Survey Mitigation published online at <https://www.boem.gov/Conditional-Archaeological-Mitigation/>.

Resource	Reason For No Further Analysis
	restrictions over NWR and parks and other ecologically sensitive areas, and to continue enforcement of regulations regarding marine trash and debris.
Human/Socioeconomic Resources	
<p>The coastal zone of the GOM is not a physically, culturally, or economically homogenous unit. The counties and parishes along the Gulf Coast cover approximately 1,631 mi (2,625 km) and includes multiple uses for recreational activities (beaches), deepwater ports, oil and gas support industries, manufacturing, farming, ranching, and hundreds of thousands of acres of wetlands and protected habitat. Offshore oil and gas activities affect onshore areas because of the various industries involved and because of the complex supply chains for these industries. Many of these impacts occur in counties and parishes along the GOM region. Employment stability in the oil and gas industry and its support sectors correlates directly with fluctuations in OCS oil- and gas-related activity levels, which are, in turn, closely related to the changes in oil and gas commodity prices.</p>	<p>The potential impacts resulting from the industry's routine activities occur within the larger socioeconomic context of the GOM region. Given the existing, extensive, and widespread support system for the OCS oil- and gas-related industry and its associated labor force, the impacts of routine activities related to a single lease sale are expected to be negligible, widely distributed, and to have little impact. Routine activities related to a single Proposed Action would be incremental in nature, not expected to change existing conditions, and positive in their contribution to the sustainability of current industry, related support services, and associated employment.</p> <p>No new or expansion of existing shore bases or onshore support infrastructure and facilities is planned as part of the Proposed Action; therefore, potential impacts are negligible.</p>
Other Marine Uses	
<p>The marine environment is used for a variety of activities and overlaps or conflicts can occur with multiple uses and/or users. The GOM is very active with existing multiple users and designated uses, including oil and gas activities, fishing (commercial or recreational), shipping, military, SSRA blocks, and artificial reefs. Future activities may include renewable energy development, aquaculture, and other alternative uses.</p>	<p>The Proposed Action would have no to negligible impacts on other marine uses, and no additional mitigation or monitoring measures are applied.</p>

3.2 AIR QUALITY

The Clean Air Act (CAA) Amendments of 1990 assigned air quality jurisdiction to the Secretary of the Interior (which was subsequently delegated to BOEM) for sources westward of 87°30' W. longitude and to the USEPA for sources eastward of 87°30' W. longitude in the Gulf of Mexico. Air emissions associated with OCS oil- and gas-related activities in the GOM contribute to ambient air pollutant levels in the surrounding onshore areas. The onshore areas include the States of Texas, Louisiana, Mississippi, Alabama, and Florida and special management areas.

The USEPA identified the following six common air pollutants of concern (referred to as criteria air pollutants): carbon monoxide (CO), lead (Pb), ozone (O₃), nitrogen dioxide (NO₂), particulate matter (PM), and sulfur dioxide (SO₂) (42 U.S.C. §§ 7401 *et seq.*). The CAA requires the USEPA to set the National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants. The USEPA designates onshore areas as “unclassifiable/attainment” or “nonattainment” status depending on the criteria air pollutants levels and their comparison with the NAAQS. Areas designated as “nonattainment” exceed a NAAQS for that criteria air pollutant. **Table 3-2** shows the current areas in nonattainment status. The term “maintenance” area refers to an area that is currently attaining the NAAQS but is still under a maintenance plan to uphold the NAAQS. In addition to the NAAQS, air quality in special management areas designated as Class I, II, or III Areas are further protected by the maximum allowable concentration increases, also referred to as the Prevention of Significant Deterioration (PSD) increments. The protections on air quality in Class I Areas are more stringent than Class II and III Areas. Moreover, the Federal land managers of Federal Class I Areas are responsible to protect the air quality-related values (AQRVs).

Table 3-2. Nonattainment and Maintenance Areas on the U.S. Gulf Coast

State	Area	8-hr O ₃ (1997)	8-hr O ₃ (2008)	SO ₂ (2010)	Lead (2008)
Alabama	Troy				NAA
Florida	Tampa				NAA
	Hillsborough County			NAA	
	Nassau County			NAA	
Louisiana	Baton Rouge	M	M		
	St. Bernard Parish			NAA	
Texas	Beaumont-Port Arthur	M			
	Houston-Galveston-Brazoria	NAA	NAA		
	Frisco				NAA

M = maintenance area; NAA = nonattainment area; O₃ = ozone; SO₂ = sulfur dioxide. Blank cells indicate that the area is in attainment of the NAAQS.

Source: USEPA, 2021.

3.2.1 Affected Environment

The proposed activities are located approximately 115 mi (185 km) from the nearest coastline of Louisiana. The air emission-related activity covers surface areas in Green Canyon 564. The air

quality over Federal OCS water is not classified. **Table 3-2** displays the current nonattainment and maintenance areas in the surrounding onshore areas; all other onshore areas are in unclassifiable/attainment status. Any annual air pollutant(s) level(s) that exceed an emission exemption amount in 30 CFR § 550.303(d) will require additional air quality analyses per 30 CFR § 550.303(e)-(i). If there is an exceedance in an emission exemption amount, air quality modeling will estimate onshore air concentration(s) from the highest emissions (except for volatile organic compounds [VOC]) emitted from the development and production activities.

A comparison between the modeled onshore air concentration(s) and significance level(s) (or NAAQS if no significance levels exist for the averaging period) determines if the impacts to the onshore ambient air concentrations are significant. Any air pollutants above the significance levels (or exemption amount for VOCs or NAAQS if no significance levels exist) are defined as having a significant contribution to the violation of the NAAQS. If the emissions are significant, the emissions shall be reduced through the application of best available control technology (BACT). Also, air quality modeling must be performed for the maximum allowable concentration increases (refer to 30 CFR § 550.303(i)(A)).

The proposed activities will be located approximately 143 mi (244 km) from the nearest Class I Area of the Breton National Wildlife Refuge (NWR) and Wilderness Area. For sources within 31 mi (50 km) from a Class I Area, VISCREEN modeling is an appropriate way of evaluating visibility (1 of 3 AQRVs) impacts. For sources within 124 mi (200 km) from a Class I Area with permanent annual emissions greater than 250 tons per year (tpy), the Q/D (certain annual emissions divided by the distance from the Class I Area) concept is an appropriate way of evaluating visibility impacts. If the calculated Q/D is greater than 10, further AQRV analysis is appropriate. Air quality modeling will estimate impacts to the AQRVs of the Class I Area (Federal Land Managers Air Quality Working Group [FLAG], 2010). The modeled values are compared to the AQRVs to determine if there may be significant adverse impacts to the Class I Area of the Breton NWR and Wilderness Area. Any modeled values above the AQRV thresholds are defined as having a significant adverse impact to the Class I Area. If the Q/D is less than 10, no further AQRV impact analysis is needed.

In offshore areas where hydrogen sulfide (H_2S) may be encountered, SLAB/AERMOD modeling will be performed if concentrations are greater than 500 parts per million (ppm) as addressed in 30 CFR § 550.245. H_2S can convert to SO_2 . H_2S is not expected to be encountered in the activity area.

The air quality in the GOM is impacted by emissions from many sources. These include emissions generated by the existing OCS oil and gas program, including emissions from support vessels that service the offshore program, commercial shipping, as well as other sources. Coastal areas may be affected by emissions generated within the onshore nonattainment areas that circulate offshore and back to shore with the sea breeze. The emissions related to the Proposed Action represent a small percentage of the total emissions occurring in the GOM from all sources.

For Green Canyon 564, prior plan submittals have been approved. Both the Proposed Action and the previously authorized plan(s) include emissions from the oil and gas facility that BOEM regulates on the block and associated oil and gas vessel emissions from within a 25-mi (40-km) radius. The maximum year estimated emission from the Proposed Action are roughly 100%percent of the estimated emissions already-approved from prior plans, depending on the activity and year. These calculations are estimates only of proposed emissions. Nevertheless, the comparison shows that the Proposed Action is a large contributor to the already approved emissions.

3.2.2 Impact Analysis

The IPFs associated with the proposed activities in Green Canyon 564 that could impact the air quality include (1) air emissions emitted from routine activities (drilling and production related equipment, vessels, and flaring/venting), (2) air emissions emitted from accidental or emergency flaring/venting, and (3) air emissions emitted from an accidental oil spill. An air quality analysis was conducted on the air emission estimates presented in the S-8070 to assess potential impacts to the surrounding onshore areas. The air quality over the Federal OCS water is not classified, but air pollutant concentration(s) could exceed the NAAQS. For this SEA, impacts were evaluated and assigned levels of environmental impact caused by IPFs as listed below.

- **Negligible** – No measurable impact(s).
- **Minor** – Most impacts on the affected resource could be avoided with proper mitigation; if impacts occur, the affected resource would recover completely without mitigation once the impacting stressor is eliminated.
- **Moderate** – Impacts on the affected resource are unavoidable. The viability of the affected resource is not threatened although some impacts may be irreversible, or the affected resource would recover completely if proper mitigation is applied or proper remedial action is taken once the impacting stressor is eliminated.
- **Major** – Impacts on the affected resource are unavoidable. The viability of the affected resource may be threatened although some impacts may be irreversible, and the affected resource would not fully recover even if proper mitigation is applied or remedial action is implemented once the impacting stressor is eliminated.

Table 3-3 lists the potential IPFs and associated impact levels for each alternative. Overall, routine and accidental impacts to air quality from the proposed activities are expected to be minor.

Table 3-3. Summary of Impact Levels for Air Quality

Impact-Producing Factor	Magnitude of Potential Impact		
	Alternative 1	Alternative 2	Alternative 3
Routine Impacts			
Drilling	Negligible	Minor	NA
Production	Negligible	Minor	NA

Impact-Producing Factor	Magnitude of Potential Impact		
	Alternative 1	Alternative 2	Alternative 3
Vessel Support during Drilling and Production	Negligible	Minor	NA
Routine Flaring and Venting	Negligible	Minor	NA
Accidental Impacts			
Emergency Flaring and Venting	Negligible	Minor	NA
Oil Spill	Negligible	Minor	NA
Cumulative Impacts			
Incremental Contribution	Minor	Minor	NA
OCS Oil and Gas	Moderate	Moderate	NA
Non-OCS Oil and Gas	Moderate	Moderate	NA

A detailed discussion of the IPFs and types of impacts to air quality that could occur from the proposed activities is included in Chapter 4.1 of the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS, from which this document tiers.

3.2.2.1 Alternative 1

If selected, Alternative 1, No Action Alternative, would result in BHP not undertaking the proposed activities as described in the plan. Therefore, the site-specific IPFs to air quality would not occur. Activities related to previously issued leases and permits (as well as those that may be issued in the future under a separate decision) related to OCS oil- and gas-related activities would continue. The No Action Alternative would not significantly change the environmental impacts of all OCS oil- and gas-related activity as described in the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS; however, any previously approved, facility-related activities would be ongoing, and routine, accidental, and previously authorized impacts could still occur.

3.2.2.2 Alternative 2

If selected, Alternative 2, Proposed Action, would result in the operator undertaking the proposed activities, as requested in S-8070. As described in the analyses below, impacts to air quality from the Proposed Action are not significant to the onshore area. Impacts to visibility at the Class I Area of the Breton NWR and Wilderness Area are below the threshold, but the impacts to the remaining AQRVs (deposition and ozone effects) are uncertain. Previously approved, facility-related activities are considered in the impacts analyses, along with the Proposed Action activities, to ensure that exemption thresholds are not exceeded.

3.2.3 Routine Activities

Air quality over Federal OCS water would be affected by the emissions from the proposed operations, supporting service vessels, and aircraft. The calculated emission amounts for the proposed activities did not exceed any emission exemption amount per 30 CFR § 550.303(d). Table 3-4 shows the maximum calculated emission amounts for each air pollutant.

Since all calculated emission amounts were below the emission exemption amount, the proposed activities are not expected to significantly affect onshore air quality.

Table 3-4. Estimated Annual Emission Amounts in Tons per Year (tpy)

PM2.5	PM10	SO _x	NO _x	VOC	CO
64.27	66.26	1.60	2631.34	75.66	412.72

The proposed activities will be located greater than 124 mi (200 km) from the Class I Area of the Breton NWR and Wilderness Area; therefore, further AQRV impact analyses was not conducted for visibility. The proposed activities are not expected to cause or contribute to a significant adverse effect on visibility. The remaining AQRVs (deposition and ozone effects) are uncertain because there was no modeling performed for these impacts. However, BOEM believes that such modeling data specific to this particular Proposed Action are not essential to a reasoned choice among alternatives. BOEM considered the cumulative impact of many plan approvals to deposition and ozone effects in Chapter 4.1 of the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS, from which this document tiers. The 2018 GOM Supplemental EIS concluded that the impact on acid deposition from all the activities associated with a single lease sale would be minor to moderate and, while the 2018 GOM Supplemental EIS did not consider ozone effects as an AQRV, the impacts on ozone formation from this proposed activity are considered in the analysis of the IPFs in Table 3-2.

3.2.4 Accidental Events

Emergency Flaring and Venting

If an accidental or emergency flaring or venting of gas occurs, PM, NO_x, SO_x, CO, VOCs, and/or methane (CH₄) would be released to the atmosphere. These emissions can contribute to O₃ formation. Additionally, any flared and vented gas may contain H₂S that may convert to SO₂. In general, emergency flaring and venting events are infrequent and of short duration. The emissions (PM, NO_x, SO_x, VOCs, CH₄, CO, and SO₂) are more abundant near the site and will disperse as it travels.

Oil Spills

If an oil spill occurs, VOCs from the surface oil slick will vaporize into the atmosphere. Increases in O₃ concentrations could occur because VOCs are precursors to O₃ formation. Additionally, if a fire occurs, PM and combustion product emissions will be emitted. In general, accidental oil spill and gas release events are infrequent and are usually contained within a few days. The emissions (VOCs, PM, and combustible emissions) are more likely to be abundant near the site of the release and will disperse with distance.

Conclusion

The potential impacts of the projected emissions to the surrounding onshore areas are below all applicable significance thresholds; therefore, they are expected to be minor. Overall, routine and accidental impacts to air quality from the proposed activities are expected to be minor.

3.3 MARINE MAMMALS

3.3.1 Affected Environment

The U.S. Gulf of Mexico marine mammal community is diverse and distributed throughout the northern GOM waters. The GOM's marine mammals are represented by members of the taxonomic order Cetacea, including suborders Mysticeti (i.e., baleen whales) and Odontoceti (i.e., toothed whales), as well as the order Sirenia (i.e., manatee). Twenty-one species of cetaceans and one species of Sirenia regularly occur in the GOM and are identified in the NMFS Stock Assessment Reports (Jefferson et al., 1992; Davis et al., 2000; Roberts et al., 2016; Hayes et al., 2018, 2019, 2020, and 2021).

The project is located in Green Canyon Block 564 in water depths ranging from 4,187 – 4,188 ft (1,276 – 1,277 m).

Threatened or Endangered Marine Mammal Species

Two cetacean species, the sperm whale (*Physeter macrocephalus*) and the GOM Rice's whale¹¹ (*Balaenoptera ricei*), regularly occur in the GOM and are listed as endangered under the ESA. The Final Rule to list the sperm whale as endangered throughout its range became effective on December 2, 1970 (*Federal Register*, 1970). The Final Rule to list the GOM Rice's whale as endangered was issued and became effective on May 15, 2019 (*Federal Register*, 2019). The West Indian manatee is also listed as threatened under the ESA (*Federal Register*, 2017).

Non-ESA-Listed Marine Mammal Species

Nineteen toothed cetaceans (including beaked whales and dolphins) regularly occur in the GOM but are not ESA-listed (Hayes et al., 2021). Despite being non-listed, the Marine Mammal Protection Act of 1972 (MMPA) protects all marine mammals regardless of ESA status.

¹¹ On August 23, 2021, NMFS published a direct final rule in the Federal Register (86 FR 47022): Endangered and Threatened Wildlife and Plants; Technical Corrections for the Bryde's Whale (Gulf of Mexico Subspecies). NMFS revises the common name to the Rice's whale, the scientific name to *Balaenoptera ricei*, and the description of the listed entity to the entire species. The changes to the taxonomic classification and nomenclature do not affect the species' listing status under the ESA or any protections and requirements arising from its listing. This rule is effective October 22, 2021, without further action.

Unusual Mortality Event (UME)

Under the MMPA, an UME is defined as “a stranding that is unexpected; involves a significant die-off of any marine mammal population; and demands immediate response.” There are currently no active UMEs in the GOM. A list of active and closed UMEs with updated information can be found online (NMFS, 2021a or 2017b) <https://www.fisheries.noaa.gov/national/marine-life-distress/active-and-closed-unusual-mortality-events>.

3.3.2 Impact Analysis

The IPFs with the proposed activities in the project area (Green Canyon Block 564) that could affect marine mammals include (1) noise (drilling and/or production and vessel/aircraft noise and use of impact driving equipment); (2) vessel strike, (3) entanglement and entrapment, (4) marine trash and debris, and (5) oil/chemical spills and oil spill response. For this SEA, impacts were evaluated and assigned levels of environmental impact caused by IPFs as listed below. **Table 3-5** provides a summary of the impact analysis for marine mammals.

- **Negligible** – An individual or group of animals would be subject to nominal to slight measurable impacts. No mortality or injury to any individual would occur, and no disruption of behavioral patterns would be expected. The disturbance would last only as long as the human-caused stimulus was perceptible to the individual or group.
- **Minor** – An individual or group of animals would be subject to a human-caused stimulus and would be disturbed, resulting in an acute behavioral change. No mortality or injury to an individual or group would occur.
- **Moderate** – An individual or group of animals would be subject to a human-caused stimulus and would be disturbed, resulting in a chronic behavioral change. Individuals may be impacted but at levels that do not affect the fitness of the population. Some impacts to individual animals may be irreversible.
- **Major** – An individual or group of animals would be subject to a human-caused stimulus, resulting in physical injury or mortality, and would include sufficient numbers that the continued viability of the population is diminished, including annual rates of recruitment or survival. Impacts would also include permanent disruption of behavioral patterns that would affect a species or stock.

Table 3-5. Summary of Impact Levels to Marine Mammals

Impact-Producing Factor	Magnitude of Potential Impact		
	Alternative 1	Alternative 2	Alternative 3
Routine Activities			
Noise	None	Minor to Moderate	NA
Accidental Events			
Vessel Strike	None	Minor	NA
Marine Trash and Debris	None	Minor	NA

Impact-Producing Factor	Magnitude of Potential Impact		
	Alternative 1	Alternative 2	Alternative 3
Oil/Chemical Spills and Oil-Spill Response	None	Negligible to Minor	NA
Entanglement and Entrapment	None	Negligible	NA

3.3.2.1 Alternative 1

If selected, Alternative 1, No Action Alternative, would result in the operator not undertaking the proposed activities as described in the plan. Therefore, the direct or indirect activity-specific IPFs to marine mammals would not occur. Activities related to previously issued leases and permits (as well as those that may be issued in the future under a separate decision) related to OCS activities would not increase. The No Action Alternative would not contribute to the environmental impacts of overall OCS oil- and gas-related activity as described in the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS, and routine and accidental impacts would still occur from other activities.

3.3.2.2 Alternative 2

If selected, Alternative 2, Proposed Action, would result in the operator undertaking the proposed activities as requested and conditioned in the plan. The operator will adhere to the NMFS 2020 BO (as amended) Appendix B: “Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols,” NMFS 2021 Amended ITS Appendix C: “Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols,” Slack-line Precautions COA, and Reporting Requirements COA (BHP, 2021). Compliance with the regulations, applicable conditions of approval (COAs), NMFS 2020 BO (as amended), and 2021 Amended ITS Appendices should negate or lessen the chance of significant impacts on marine mammals under this alternative.

3.3.3 Routine Activities

Noise

Water-transmitted noise can potentially cause disturbance, masking of sounds, physiological stress, and hearing impairment on marine mammals (Richardson et al., 1995; Ellison et al., 2011). Vessel noise from the Proposed Action will produce low levels of noise, generally in the 150 to 170 dB re 1 μ Pa-m at frequencies below 1,000 Hz. Vessel noise is transitory and generally does not propagate at great distances from the vessel. The operator will adhere to the NMFS 2021 Amended ITS Appendix A: “Seismic Survey Mitigation and Protected Species Observer Protocols,” which appreciably reduces the potential for noise effects on marine mammals.

There is little information on the behavioral responses by marine mammals to drilling noise in the GOM. According to Southall et al. (2007 and 2019), for behavioral responses to non-impulsive noise sources (e.g., drill noise), data indicate considerable variability in received levels associated with behavioral responses. The source levels from drilling (154 dB and below, as cited by Greene, 1986 in Richardson et al., 1995) are below the Level A harassment threshold of 180 dB and Level B (behavioral) harassment threshold of 160 dB set by NMFS under the MMPA (NMFS, 2018). In addition to various pieces of support equipment used in construction, such as vessels and cranes, pile driving

is the primary method by which fixed structures are attached to the seafloor and provide stability for other support structures. There are two primary, pile driving operations on the OCS: (1) the setting of casing conductors (also known as drive pipe) for drilling operations; and (2) pile emplacement for securing oil and gas structures and facilities to the sea bed. The highest reported source levels for pile driving are 204 dB (SEL) and 232 dB (peak). Since these occurrences would be temporary, subject to the step-down review process per the NMFS 2020 BO (as amended), and given the applicable required mitigation measures per the NMFS 2020 BO (as amended) and 2021 Amended ITS (Appendix A: "Seismic Survey Mitigation and Protected Species Observer Protocols"), marine mammals are not expected to be significantly affected by pile driving.

The noise from helicopter activity can cause a startle response and can interrupt marine mammal resting, feeding, breeding, or migrating behavior (Richardson et al., 1995). The Proposed Action is expected to have helicopter support with multiple transits between the MODU and airbase. Since these occurrences would be temporary and pass within seconds, and given the relevant guidelines and regulations, marine mammals are not expected to be adversely affected by routine helicopter traffic operating at prescribed required Federal Aviation Administration altitudes.

Marine mammals may exhibit some avoidance behaviors, but their behavioral or physiological responses (e.g., stress) to noise associated with the Proposed Action are unlikely to have population-level impacts. Therefore, impacts to marine mammals from noise associated with the proposed activities are expected to be minor.

3.3.4 Accidental Events

Vessel Strike

The proposed activities are expected to require several round-trip supply and crew vessel trips per week. Deep-diving whales may be more vulnerable to vessel strikes given the longer surface period required to recover from extended deep dives (Laist et al., 2001; van Waerebeek et al., 2007). The operator will comply with the NMFS 2021 Amended ITS Appendix C: "Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols," which appreciably reduces the likelihood of marine mammal vessel strikes associated with the proposed activity by requiring the use of visual observers, vessel speed restrictions, and vessel separation distances (BHP, 2021). The accepted reasonable and prudent measures agreement (RPA) for the Rice's whale requires vessel restrictions in the event any service vessel transits the Rice's whale area to get to the lease block. Any BOEM/BSEE-authorized or -permitted activity occurring within the EPA is subject to a step-down review with NMFS per the 2020 BO. Thus, given operator adherence to the NMFS 2020 BO (as amended), NMFS 2021 Amended ITS Appendix C, and the RPA, acute and chronic effects on marine mammals from vessel strike are expected to be minor.

Marine Trash and Debris

Many types of plastic materials end up as solid waste during drilling and production operations. Some of this material is accidentally lost overboard. The incidental ingestion and entanglement of

marine debris could adversely affect marine mammals (Gregory, 2009; Gall and Thompson, 2015). The operator will adhere to the NMFS 2020 BO (as amended) Appendix B: “Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols,” which appreciably reduces the likelihood of marine mammals encountering marine debris from the proposed activity (BHP, 2021). Thus, effects on marine mammals from marine trash and debris are expected to be minor.

Oil/Chemical Spills and Oil-Spill Response

The range of toxicity and degree of sensitivity to hydrocarbons and the effects of ongoing/post-response activities on cetaceans are unknown. Oil from an oil spill can cause soft tissue irritation, fouling of baleen plates, respiratory stress from the inhalation of toxic fumes, food reduction or contamination, direct ingestion of oil and/or tar, and temporary displacement from preferred habitats (Geraci and St. Aubin, 19A90; Lee and Anderson, 2005; NOAA, 2010a and 2010b; Schwacke et al., 2014). Long-term impacts on marine mammal populations are poorly understood but could include decreased survival and lowered reproductive success. Dispersants may contain ingredients that are known to irritate sensitive tissues of marine mammals (NRC, 2005). Chemical dispersion of oil may considerably reduce the impacts on marine mammals, primarily by reducing their exposure to petroleum hydrocarbons (French-McCay, 2004; NRC, 2005). Because the potential occurrence of a spill and contact with species is low due to applicable regulatory requirements (refer to **Chapter 1.5**) in this plan submittal, the effects on marine mammals from oil/chemical spills and oil-spill response are expected to be negligible.

Entanglement and Entrapment

Entanglement and entrapment can result in death or injury of marine mammals (Moore et al., 2009; Van Der Hoop et al., 2012). Entangled marine mammals may drown or starve due to being restricted by gear, suffer physical trauma and systemic infections, and/or be hit by vessels due to an inability to avoid them. Entanglement can also cause injury that can lead to secondary infection, or cause death (Moore, 2014). Entanglement as a stressor is possibly created by seismic survey equipment such as ocean bottom nodes, hydrophones, geophones and other cables; other survey activities including sediment sampling and installation of mooring buoys; and marine debris generated from these activities. Moon pools are too small to allow a GOM marine mammal to enter and are therefore unlikely to entrap them. The operator will adhere to the NMFS 2020 BO (as amended) and 2021 Amended ITS Slack-line Precautions COA, Moon Pool Monitoring COA, and Reporting Requirements COA, which appreciably reduce the likelihood of marine mammals being entangled or entrapped in gear from the proposed activity (BHP, 2021). With applicable required mitigation measures per the NMFS 2020 BO (as amended) and 2021 Amended ITS and other mitigation measures such as the protected species stipulation, marine mammal entanglement in hydrophone cables and streamers, geophones, bottom cables, and other associated gear is unlikely to occur. Thus, because the possibility of entanglement and entrapment is low and since the operator will adhere to the Slack-line Precautions, Moon Pool Monitoring, and Reporting Requirements mitigation measures, the effects on marine mammals are expected to be negligible.

Conclusion

Long-term or permanent displacement of the animals from preferred habitats and the destruction or adverse modification of any habitats are not expected to occur due to the scope, timing, and the short-term nature of the proposed activities. Furthermore, the conditions of approval and monitoring requirements are expected to prevent vessel strikes from increasing to the level of significance. The noise related to the proposed drilling operation is not expected to result in auditory effects, behavioral change, masking, or non-auditory effects to marine mammals that would rise to the population level. Based on the above analysis, BOEM finds that the potential for such effects from the Proposed Action is unlikely to rise to significant levels.

3.4 SEA TURTLES

3.4.1 Affected Environment

Five sea turtle species, all federally listed as threatened or endangered, are known to inhabit the waters of the GOM: leatherback (*Dermochelys coriacea*); green (*Chelonia mydas*); hawksbill (*Eretmochelys imbricata*); Kemp's ridley (*Lepidochelys kempii*); and loggerhead (*Caretta caretta*). These species are all highly migratory, and individual animals will migrate into nearshore waters as well as other areas of the North Atlantic Ocean, GOM, and Caribbean Sea. Critical habitat has been designated for the Northwest Atlantic Ocean Loggerhead sea turtle distinct population segment (DPS) in the GOM (*Federal Register*, 2014b).

The project is located in Green Canyon Block 564 in water depths ranging from 4,187 – 4,188 ft (1,276 – 1,277 m).

3.4.2 Impact Analysis

Sea turtles are susceptible to many natural and human impacts, including impacts while on land, in the benthic environment, and in the pelagic environment due to their life history. The IPFs associated with the proposed activities in Green Canyon Block 564 that could affect sea turtles include (1) noise (drilling and/or production and vessel/aircraft noise and use of impact-driver equipment), (2) vessel strike, (3) entanglement and entrapment, (4) marine trash and debris, and (5) oil/chemical spills and oil-spill response. For this SEA, impacts were evaluated and assigned levels of environmental impact caused by IPFs as listed below. **Table 3-6** provides a summary of impact to sea turtles.

- **Negligible** – An individual or group of animals would be subject to nominal to slight measurable impacts. No mortality or injury to any individual would occur, and no disruption of behavioral patterns would be expected. The disturbance would last only as long as the human-caused stimulus was perceptible to the individual or group.
- **Minor** – An individual or group of animals would be subject to a human-caused stimulus and would be disturbed, resulting in an acute behavioral change. No mortality or injury to an individual or group would occur.

- **Moderate** – An individual or group of animals would be subject to a human-caused stimulus and would be disturbed, resulting in a chronic behavioral change. Individuals may be impacted but at levels that do not affect the fitness of the population. Some impacts to individual animals may be irreversible.
- **Major** – An individual or group of animals would be subject to a human-caused stimulus, resulting in physical injury or mortality, and would include sufficient numbers that the continued viability of the population is diminished, including annual rates of recruitment or survival. Impacts would also include permanent disruption of behavioral patterns that would affect a species or stock.

Table 3-6. Summary of Impact Levels to Sea Turtles

Impact-Producing Factor	Magnitude of Potential Impact		
	Alternative 1	Alternative 2	Alternative 3
Routine Activities			
Noise	None	Negligible to Minor	NA
Accidental Events			
Vessel Strike	None	Negligible to Minor	NA
Marine Trash and Debris	None	Negligible	NA
Oil/Chemical Spills and Oil-Spill Response	None	Negligible to Minor	NA
Entanglement and Entrapment	None	Negligible to Minor	NA

3.4.2.1 Alternative 1

If selected, Alternative 1, No Action alternative, would result in the operator not undertaking the proposed activities as described in the plan. Therefore, direct or indirect activity-specific IPFs to sea turtles would not occur. Activities related to previously issued leases and permits (as well as those that may be issued in the future under a separate decision) related to the OCS activities would not increase. The No Action Alternative would not contribute to the environmental impacts of overall OCS oil- and gas-related activity as described in the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS, and routine and accidental impacts would still occur from other activities.

3.4.2.2 Alternative 2

If selected, Alternative 2, Proposed Action, would result in the operator undertaking the proposed activities as requested and conditioned in the plan, and applicable regulations. The operator will adhere to NMFS 2020 BO (as amended) Appendix B: “Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols,” NMFS 2021 Amended ITS Appendix C: “Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols,” NMFS 2020 BO (as amended) Appendix J: “Sea Turtle Handling and Resuscitation Guidelines,” Slack-line Precautions COA, and Reporting Requirements COA (BHP, 2021). Compliance with the regulations, applicable COAs, NMFS 2020 BO (as amended), and NMFS 2021 Amended ITS Appendices should negate or lessen the chance of significant impacts on sea turtles under this alternative.

3.4.3 Routine Activities

Noise (Vessels and Equipment)

Vessel noise from the proposed activities would produce low levels of noise, generally in the 150 to 170 dB re 1 μ Pa-m at frequencies below 1,000 Hz. Vessel noise is transitory and generally does not propagate at great distances from the vessel. Though there are few studies on sea turtle bioacoustics, available information indicates that sea turtles are in the low-frequency (100 Hz to 2 kHz) hearing range (Bartol and Musick, 2003; Popper et al., 2014). The operator will adhere to the NMFS 2021 Amended ITS Appendix A: “Seismic Survey Mitigation and Protected Species Observer Protocols,” which appreciably reduces the potential for noise effects on sea turtles.

In addition to various pieces of support equipment used in construction, such as vessels and cranes, pile driving is the primary method by which fixed structures are attached to the seafloor and provide stability for other support structures. There are two primary pile driving operations on the OCS: (1) the setting of casing conductors (also known as drive pipe) for drilling operations; and (2) pile emplacement for securing oil and gas structures and facilities to the sea bed. The highest reported source levels for pile driving are 204 dB (SEL) and 232 dB (peak). Pressure waves compress and decompress molecules of the surrounding medium as they pass, which can injure ears and is detectable by other vibration-sensitive body parts such as the carapace of sea turtles. Since these occurrences would be temporary, subject to the step-down review process per the NMFS 2020 BO (as amended) and given the applicable required mitigation measures per the NMFS 2020 BO (as amended) and 2021 Amended ITS (Appendix A: “Seismic Survey Mitigation and Protected Species Observer Protocols”), sea turtles are not expected to be significantly affected or permanently displaced by pile driving; thus, associated impacts are expected to be negligible to minor.

Drilling activities produce intermittent, sudden, and, at times, high-intensity sounds transmitted into the water as operations occur. However, sea turtles are not expected to be impacted by this disturbance (Popper et al., 2014). Sea turtles’ currently known thresholds for auditory injury are fairly high for impulsive noise sources (Samuel et al., 2005; Nunny et al., 2008; Popper et al., 2014). The most likely impact of drilling or vessel noise on sea turtles is behavioral disturbance, but these impacts are not expected to be long-lasting or widespread. Therefore, impacts to sea turtles from noise associated with the proposed drilling activities are expected to be negligible.

3.4.4 Accidental Events

Vessel Strike

Sea turtles spend at least 3-6 percent of their time at the surface for respiration and perhaps as much as 26 percent of their time at the surface for basking, feeding, orientation, and mating (Lutcavage et al., 1997). There have been no known documented sea turtle collisions with drilling and service vessels in the GOM (typical cruising speed is 10 knots [11.5 miles per hour]); however, collisions with small or submerged sea turtles may go undetected. The operator will adhere to the NMFS 2021 Amended ITS Appendix C: “Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols,” which minimizes the potential for vessel strikes by

requiring the use of visual observer (e.g., captain), vessel speed restrictions, and separation distances. Thus, effects on sea turtles from vessel strike are expected to be negligible but might be minor for undetected sea turtles underwater (e.g., vessel displacing water inadvertently moving sea turtles in wake).

Marine Trash and Debris

Many types of plastic materials could end up as solid waste during drilling and production operations. Some of this material is accidentally lost overboard, where sea turtles could consume it or become entangled in it. The incidental ingestion or entanglement of marine debris could adversely affect sea turtles (Gall and Thompson, 2015; Schuyler et al., 2016). The operator will adhere to the NMFS 2020 BO (as amended) Appendix B: “Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols,” which appreciably reduces the likelihood of sea turtles encountering marine debris from the proposed activity. Thus, effects on sea turtles from marine trash and debris are expected to be negligible.

Oil/Chemical Spills and Oil-Spill Response

The range of toxicity and degree of sensitivity to oil hydrocarbons and the effects of response activities on sea turtles are unknown. The oil from an oil spill can adversely affect sea turtles by causing soft tissue irritation, respiratory stress from inhalation of toxic fumes, food reduction or contamination, direct ingestion of oil and/or tar, and temporary displacement from preferred habitats (Lutz and Lutcavage, 1989; Milton et al., 2003; NOAA 2010). The long-term impacts on sea turtle populations are poorly understood but could include decreased survival and lowered reproductive success. Impacts from the dispersants are unknown in the absence of direct testing but may have similar irritants to tissues and sensitive membranes (NRC, 2005; Shigenaka et al., 2010; NOAA, 2015). BOEM will continue to monitor these resources for effects caused by the use of dispersants and will ensure that future BOEM environmental reviews take into account any new information that may emerge. Because the potential for an oil spill and contact with species are low due to applicable regulatory requirements (refer to **Chapter 1.5**) in this plan submittal, the potential effects on sea turtles from oil/chemical spills and oil-spill response are expected to be negligible using applicable scientifically credible information.

Entanglement and Entrapment

Entanglement as a stressor is possibly created by seismic survey equipment such as diver lines, ocean bottom nodes, hydrophones, geophones and other cables; and other survey activities, including sediment sampling and installation of mooring buoys; and marine debris generated from these activities. Entanglement and entrapment can result in death or injury of sea turtles. Sea turtles have become entrapped in dredge equipment (NRC, 1990) and have the potential to become entrapped in any submerged structure that an individual is able to enter. Fish and other animals can enter moon pools and, in the case of sea turtles, surface within moon pools, potentially being entrapped. The operator will adhere to the NMFS 2020 BO (as amended) and 2021 Amended ITS Slack-line Precautions COA, Moon Pool Monitoring COA, and Reporting Requirements COA, which

appreciably reduce the likelihood of sea turtles being entangled or entrapped in gear from the proposed activity (BHP, 2021). With applicable required mitigation measures per the NMFS 2020 BO (as amended) and 2021 Amended ITS and other mitigation measures such as the protected species stipulation, sea turtle entanglement in diver lines, hydrophone cables and streamers, geophones, bottom cables, and other associated gear, in addition to sea turtle entrapment in moon pools (though typically remains open to water if used), is unlikely to occur. Thus, because the possibility of entanglement and entrapment is low and since the operator will adhere to the Slack-line Precautions, Moon Pool Monitoring, and Reporting Requirements COA, the effects on sea turtles are expected to be negligible to minor.

Conclusion

Long-term or permanent displacement of the animals from preferred habitats and the destruction or adverse modification of any habitats are not expected to occur due to the scope, timing, and short-term nature of the proposed activities. Furthermore, the conditions of approval and monitoring requirements are expected to prevent vessel strikes from increasing to a level that results in population-level effects. Further, the noise related to the proposed drilling operation is not expected to result in auditory effects, behavioral change, masking, or non-auditory effects to sea turtles in the GOM that would rise to the population level. BOEM finds that the potential effects of the proposed activity on sea turtles would not rise to a level of significance.

4 CONSULTATION AND COORDINATION

Coastal Zone Management Act

Per 15 CFR part 930 subpart D (private activities that require a Federal permit or license) and subpart E (OCS plans), proposed activities must be “fully consistent” with enforceable policies of a State’s coastal management program. BHP received consistency concurrence from the State of Louisiana on September 11, 2015 under EP N-9883.

Endangered Species Act

The Endangered Species Act (ESA) of 1973 (16 U.S.C. §§ 1531 *et seq.*), as amended, establishes a national policy designed to protect and conserve threatened and endangered species and the ecosystems upon which they depend. Section 7(a)(2) of the ESA requires each Federal agency to ensure that any action that it authorizes, funds, or carries out is not likely to jeopardize the continued existence of a listed species or result in the adverse modification of designated critical habitat.

BOEM and BSEE engaged in consultation under the ESA with NMFS and FWS. On March 13, 2020, NMFS issued a BO and related terms and conditions for OCS oil and gas activities in the GOM for the protection of ESA-listed species, including holding lease sales (requirements noted within Information to Lessees and lease stipulations). On April 26, 2021, NMFS issued the “Amended Incidental Take Statement and Revised Appendices to the Programmatic Biological Opinion on the Gulf of Mexico Oil and Gas Program.” The NMFS 2020 BO (as amended) and 2021 Amended ITS also addresses any future lease sales and any approvals issued by BOEM and BSEE, under both existing and future OCS oil and gas leases in the GOM, over a 10-year period commencing March 2020. Applicable terms and conditions and reasonable and prudent measures from the NMFS 2020 BO (as amended) and 2021 Amended ITS will be applied at the lease sale stage. Other specific conditions of approval will also be applied to postlease approvals and have been applied in this instance.

In November 2020, BOEM and BSEE in the spirit of adaptive management and in agreement with NMFS, submitted revised procedures for the NMFS 2020 BO, in that, some activities previously requiring step-down review by NMFS to not be continued and apply programmatic standardized mitigation measures to protect resources. BOEM petitioned NMFS for rulemaking under the MMPA, to assist industry in obtaining incidental take coverage for marine mammals due to oil and gas and G&G surveys in the GOM. NMFS issued a final rule as a result of the petition on Tuesday, January 19, 2021 (86 FR 5322) with an effective date of April 19, 2021. On April 26, 2021, the NMFS 2020 BO was amended to incorporate adaptive management for step-down review, MMPA Rulemaking, and revised Appendices A, C, and I.

Based on BOEM’s internal step-down review of January 6, 2022, this plan does not require a step-down review by NMFS. BOEM concludes the action or activity may affect listed species or critical

habitat, but it is an action or activity whose effects have been covered programmatically by this programmatic biological opinion.

On April 20, 2018, the FWS issued a 10-year BO for BOEM and BSEE activities in the GOM, including lease sales and approvals of all “on the water” activities during this time. The FWS 2018 BO does not include any terms and conditions for the protection of endangered species that the Bureaus, lessees, or operators must implement. The FWS also noted that any future consultations may be informal, dependent upon the likelihood of take. This plan is being reviewed in accordance with both BOs, and the applicable terms and conditions and reasonable and prudent measures of the NMFS 2020 BO will be applied to the activities proposed under the plan.

Marine Mammal Protection Act

BOEM petitioned NMFS for rulemaking under the Marine Mammal Protection Act (MMPA) (16 U.S.C. §§ 1361 *et seq.*) to assist industry in obtaining incidental take coverage for marine mammals due to oil and gas G&G surveys in the GOM. The MMPA Incidental Take Regulation (ITR) was finalized on January 19, 2021, and implemented on April 19, 2021. The rule will be in place for 5 years.

Magnuson-Stevens Fishery Conservation and Management Act

Pursuant to Section 305(b) of the Magnuson-Stevens Fishery Conservation and Management Act, Federal agencies are required to consult with NMFS on any action that may result in adverse effects to EFH. The NMFS published the final rule implementing the EFH provisions of the Magnuson-Stevens Fisheries Conservation and Management Act (50 CFR part 600) on January 17, 2002. Certain OCS oil- and gas-related activities authorized by BOEM may result in adverse effects to EFH and therefore require EFH consultation. As such, BOEM prepared the *Essential Fish Habitat Assessment for the Gulf of Mexico* technical report on behalf of BOEM and BSEE; it describes the routine activities on the Gulf of Mexico OCS, analyzes the effects of routine and accidental activities on EFH, and identifies mitigating measures (BOEM, 2016d). The 2017-2022 Programmatic EFH consultation with NMFS was concluded on September 14, 2017, with BOEM and BSEE concurrence with NMFS’ conservation recommendations. The agreed upon conservation recommendations contain provisions for bottom-disturbing activities that would trigger an individual project-specific EFH consultation when they occur within specified distances of topographic features and live-bottom (Pinnacle Trend) features (refer to NTL 2009-G39).

National Historic Preservation Act

In accordance with the NHPA (54 U.S.C. §§ 300101 *et seq.*), Federal agencies are required to consider the effects of their undertakings on historic properties. The implementing regulations for Section 106 of the NHPA, issued by the Advisory Council on Historic Preservation (36 CFR part 800), specify the required review process. In accordance with 36 CFR § 800.8(c), BOEM uses the NEPA substitution process and documentation to comply with Section 106 of the NHPA. Because of the extensive geographic area analyzed in the 2017-2022 GOM Multisale EIS and 2018 GOM

Supplemental EIS, BOEM defers identification of historic properties and completion of the Section 106 review process until site-specific analysis of postlease activities can be completed prior to approving those activities. Due to the site-specific analysis described in this SEA and additional mitigation measures, if applicable, BOEM has determined that no significant impacts to historic properties are likely to occur as a result of the Proposed Action.

Clean Air Act

The CAA Amendments of 1977 designated 156 Class I Areas, consisting of national parks and wilderness areas that are offered special protection for air quality and the AQRVs. Breton National Wildlife Refuge and Wilderness Area in Louisiana is a Class I Area. The Class I Areas, compared to the Class II Areas, have lower Prevention of Significant Deterioration (PSD) air quality increments that new sources may not exceed and are protected against excessive increases in several AQRVs, including visibility impairment, acid (sulfur and nitrogen) deposition, and nitrogen eutrophication. The Regional Haze Rule (40 CFR § 51.308) has a goal of natural visibility conditions by 2064 at Class I Areas, and States must submit Regional Haze Rule State Implementation Plans that demonstrate progress towards that goal.

The proposed activities are located 152 mi (245 km) from the Breton NWR and Wilderness Area; therefore, coordination with FWS was not required.

Clean Water Act

The USEPA (Regions 4 and 6) regulates the discharge of routine operational waste streams generated from offshore oil- and gas-related activities. Section 403 of the CWA requires that NPDES permits be issued for discharges to State territorial waters, the contiguous zone, and the ocean in compliance with the USEPA's regulations for preventing unreasonable degradation of the receiving waters. There are two general NPDES permits that cover the GOM. Permit GMG290000, issued by USEPA Region 6, covers the WPA and CPA; Permit GEG460000, issued by USEPA Region 4, covers the EPA and a small part of the CPA.

The final NPDES General Permit No. GMG290000 for "New and Existing Sources and New Dischargers in the Offshore Subcategory of the Oil and Gas Extraction Point Source Category for the Western Portion of the Outer Continental Shelf of the Gulf of Mexico" was reissued by USEPA Region 6 on September 19, 2017, with an effective date of October 1, 2017, and an expiration date of September 30, 2022. Permittees covered by the previous version of the permit, which expired on September 30, 2017, were automatically covered by the reissued permit starting on October 1, 2017 (USEPA, 2017a; USEPA, 2017c).

Government-to-Government Tribal Consultation

In accordance with Executive Order 13175, "Consultation and Coordination with Indian Tribal Governments," Federal agencies are required to establish regular and meaningful consultation and collaboration with Tribal officials in the development of Federal policies that have Tribal implications

to strengthen the United States' government-to-government relationships with Indian Tribes and to reduce the imposition of unfunded mandates upon Indian Tribes.

BOEM has formally invited Tribal Nations with current or ancestral ties to the Gulf of Mexico region to consult on the development of OCS oil- and gas-related activities, including the 2017-2022 National OCS Program and Programmatic EIS, 2017-2022 GOM Multisale EIS, 2018 GOM Supplemental EIS, and the *Gulf of Mexico OCS Proposed Geological and Geophysical Activities: Western, Central, and Eastern Planning Areas; Final Programmatic Environmental Impact Statement* (BOEM, 2017c). Tribes that BOEM has invited to consult on these activities include the Alabama-Coushatta Tribe of Texas, Caddo Nation of Oklahoma, Chitimacha Tribe of Louisiana, Choctaw Nation of Oklahoma, Coushatta Tribe of Louisiana, Jena Band of Choctaw Indians, Miccosukee Tribe of Indians of Florida, Mississippi Band of Choctaw Indians, Muscogee (Creek) Nation, Poarch Band of Creek Indians, Seminole Tribe of Florida, Seminole Nation of Oklahoma, and Tunica-Biloxi Indian Tribe of Louisiana.

No tribes have accepted invitations for government-to-government consultation on these activities; however, tribal representatives have requested to be notified if any pre-contact archaeological resources are identified and/or adversely impacted by BOEM-permitted activities. To date, no such discoveries or adverse impacts have occurred. Were they to occur during activities associated with the proposed plan, BOEM will notify and invite consultations with the above tribes as requested.

5 PUBLIC COMMENT

BHP's S-8070 EP was deemed submitted (as per 30 CFR § 550.231) on February 17, 2022, and it was placed on <https://www.regulations.gov> for a 10-day public review. At the end of the comment period on March 1, 2022, no public comments were received.

APPENDICES

A IMPACT-PRODUCING FACTOR DESCRIPTIONS

Descriptions of the impact-producing factors (IPFs) are provided below. The information provided below are summaries of the information included in the main text of this SEA. Additional detailed information can also be found in the 2017-2022 GOM Multisale EIS and 2018 GOM Supplemental EIS (BOEM, 2017a and 2017b).

Routine Activities

- (1) **Bottom disturbance** from well and anchor emplacement and drilling activities – Physical disturbance to the seabed, benthic habitats, and/or communities. Typically, wells drilled in shallow water (0-300 m [0-984 ft]) create a splay of drilling muds and cuttings that spread 250 m (820 ft) from the well, and the coverage area would be approximately 500 m (1,640 ft) from the well in deepwater (300 to 1,524 m [984 to 5,000 ft]) and ultra deepwater (greater than 1,524 m [5,000 ft]) water depths.
- (2) **Noise** from drilling activities and vessel and helicopter transportation – A subjective term reflective of societal values regarding what constitutes unwanted or undesirable intrusions of sound. Noise generated from these activities can be transmitted through both air and water, and may be of long or short duration, distance, and sound level. The intensity level and frequency of the noise emissions are highly variable, both between and among the various types of sound sources, along with the received sound levels to the resources. The primary sources of vessel noise are propeller cavitation, propeller singing, and rotating machinery; other sources include auxiliaries, flow noise from water dragging along the hull, and bubbles breaking in the wake (Richardson et al., 1995)¹². Drilling operations (these can include pile driving, generators, pumps, etc.) often produce noise that includes strong tonal components at low frequencies, including infrasonic frequencies in at least some cases¹³.
- (3) **Discharges and Wastes** from vessel operations and exploration activities – Releases into the environment resulting from multiple sources. The primary operational wastes and discharges generated during offshore oil and gas

¹² The intensity of noise from service vessels is roughly related to ship size, laden or not, and speed. Large ships tend to be noisier than small ones, and ships underway with a full load (or towing or pushing a load) produce more noise than empty vessels. For example, a 16-m (52-ft) crewboat may have a 90-hertz (Hz) tone with a source level of 156 dB re: 1µPa, and a small ship may have a broadband source level of 170-180 dB re: 1µPa (Richardson et al., 1995). Helicopter sounds contain dominant tones (resulting from rotors) generally below 500 Hz (Richardson et al., 1995).

¹³ Dynamically positioned MODUs (drillships and semisubmersibles) are noisier than anchored MODUs (Richardson et al., 1995). Sound and vibration paths to the water are through either the air or the risers, in contrast to the direct paths through the hull of a drillship. Sound from drilling activities has been measured from the 20- to 1,000-Hz band levels at a range of 1.8 km (1.1 mi) at levels of 113-126 dB re: 1µPa.

exploration and development are drilling fluids, drill cuttings, various waters (e.g., bilge, ballast, fire, and cooling), deck drainage, sanitary wastes, and domestic wastes. During production activities, additional waste streams include produced water, produced sand, and well-treatment, workover, and completion fluids. Minor additional discharges occur from numerous sources. These discharges may include desalination unit discharges, blowout preventer fluids, boiler blowdown discharges, excess cement slurry, several fluids used in subsea production, and uncontaminated freshwater and saltwater.

- (4) **Space Use Conflicts** – Wells, platforms, pipelines, subsea infrastructure, and other structures create obstructions to the recovery of marine minerals and other existing or future users (commercial and recreational fishing, aquaculture, renewable, artificial reefs, etc.) of the OCS. BOEM is required to consider the impact of the proposed activities on other users of the Gulf of Mexico OCS. For marine minerals, no-dredging zones are 500 ft (152 m) from any structure and 1,000 ft (305 m) from a pipeline. The well and platforms would be permanent obstructions, even if removed to 15 ft (5 m) below the substrate, as dredging cannot be performed within 500 ft (152 m) due to the risk to the dredge and infrastructure. The pipeline obstruction could be temporary in that pipelines can be removed upon abandonment. All military activities in the Gulf of Mexico OCS occur within military warning areas designated by the Federal Aviation Administration in coordination with the U.S. Department of Defense. Lessees and permittees conducting oil and gas operations within these warning areas are required to coordinate with the appropriate military command.
- (5) **Air Emissions** from equipment and vessels – Emissions associated with drilling from OCS oil- and gas-related activities are attributed to gasoline, diesel, and natural gas fuel usage in engines such as propulsion engines, prime engines, mud pumps, draw works, and emergency power. Emissions associated with production from OCS oil- and gas-related activities are attributed to boilers, diesel engines, combustion flares, fugitives, glycol dehydrators, natural gas engines, turbines, pneumatic pumps, pressure/level controllers, storage tanks, cold vents, and others. Pollutants emitted during drilling activities include combustion gases (i.e., CO, NO_x, PM, SO₂, CO₂, CH₄, and N₂O), as well as non-combustion sources (i.e., VOCs, PM, and CH₄)¹⁴.

Accidental events

- (1) **Oil/Chemical Spills** (loss of well control and chemical/drilling fluid) **and Oil-Spill Response** – BSEE requires operators to report any spill greater than 1 barrel (bbl) (42 gallons [gal]) occurring on the OCS and maintains a database for all

¹⁴ CO – carbon monoxide; NO_x – nitrogen oxide; PM – particulate matter; SO₂ – sulfur dioxide; CO₂ – carbon dioxide; CH₄ – methane; N₂O – nitrous oxide; and VOC – volatile organic compound.

reported incidents¹⁵. All losses of well control are required to be reported to BSEE.

Loss of Well Control

The current definition for loss of well control is as follows:

- uncontrolled flow of formation or other fluids (the flow may be to an exposed formation [an underground blowout] or at the surface [a surface blowout]);
- uncontrolled flow through a diverter; and/or
- uncontrolled flow resulting from a failure of surface equipment or procedures.

Not all loss of well control events would result in a blowout as defined above, but they are most commonly thought of as releases to the human environment. A loss of well control can occur during any phase of development, i.e., exploratory drilling, development drilling, well completion, production, or workover operations. A loss of well control can occur when improperly balanced well pressure results in sudden, uncontrolled releases of fluids from a wellhead or wellbore (PCCI Marine and Environmental Engineering, 1999; Neal Adams Firefighters, Inc., 1991).

The physical and chemical properties of oil greatly affect its transport and fate in the environment. Following a spill, the composition of the released oil can change substantially due to weathering processes such as evaporation, emulsification, dissolution, and oxidation. The ultimate fate of oil in the environment and its impacts are influenced not only by the magnitude, spatial extent, and duration of the event but also by the response methods that may be employed. Horizontal transport of oil is accomplished through spreading, advection, dispersion, and entrainment. Vertical transport involves dispersion, entrainment, Langmuir circulation (a series of shallow, slow, counter-rotating vortices at the ocean's surface aligned with the wind developed when wind blows steadily over the sea surface), sinking, overwashing, partitioning, and sedimentation.

Chemical and Drilling Fluid Spills

Chemicals and synthetic-based drilling fluids are considered because they may be persistent (nondegradable) and are comparatively toxic. A study of chemical spills from OCS oil and gas activities determined that only two chemicals could potentially impact the marine environment – zinc

¹⁵ Not included in BSEE's data records are spills less than 1 bbl. Spills of any size and composition are required to be reported to the U.S. Coast Guard's (USCG) National Response Center and are further documented in the USCG's Marine Information for Safety and Law Enforcement (2001-present) database and its predecessors. Also not included in BSEE's database are spills that have occurred in Federal waters from OCS barging operations and from other service vessels that support the OCS oil and gas industry. These data are included in the USCG's record of all spills; however, the USCG's database does not include the source of oil (OCS versus non-OCS) or in the case of spills from vessels, the type of vessel operations; such information is needed to determine if a particular spill occurred as a result of OCS operations. Spills from vessels are provided for tankers in worldwide waters and tankers and barges in U.S. coastal and offshore waters.

bromide and ammonium chloride (Boehm et al., 2001). Other common chemicals spilled include methanol and ethylene glycol, which are used in deepwater and ultra deepwater operations where gas hydrates tend to form due to cold temperatures. These alcohol-based chemicals are nonpersistent (degradable) and exhibit comparatively low toxicity.

- (1) **Air emissions** from emergency flaring/venting and/or oil spills – Activities that produce emissions include drilling operations, platform construction and emplacement, platform operations, flaring, fugitive emissions, evaporation of volatile organic compounds during transfers and spills, and support vessel emissions. Various onshore facility activities supporting offshore oil and gas operations, or receiving oil or gas from them, emit air pollutants. This includes emissions from helicopters, vessels, stationary engines (e.g., generators), and equipment leaks (i.e., fugitive emissions). The USEPA defined criteria pollutants released by OCS sources include CO, NO₂, PM₁₀, PM_{2.5} and SO₂.
- (2) **Vessel Strike (Vessel to Marine Species or Habitat) and Collisions (Vessel to Vessel; Vessel to Structure)** – BOEM’s data show that, from 2007 through 2019, there were 181 OCS oil- and gas-related vessel collisions (BSEE, 2021). Most collision mishaps are the result of service vessels colliding with platforms or vessel collisions with pipeline risers. Fires resulted from hydrocarbon releases in several of the collision incidents. Diesel fuel is the product most frequently spilled, while oil, natural gas, corrosion inhibitor, hydraulic fluid, and lube oil have also been released as the result of a vessel collision. Approximately 10 percent of vessel collisions with platforms in the OCS caused diesel spills.

Vessels could strike marine mammals, sea turtles, and other marine animals during transit. To limit or prevent such strikes, the National Marine Fisheries Service (NMFS) provides all boat operators with whale-watching guidelines, which is derived from the Marine Mammal Protection Act (MMPA). These guidelines suggest safe navigational practices based on speed and distance limitations when encountering marine mammals. Requirements in the NMFS 2021 Amended ITS Appendix C: “Gulf of Mexico Vessel Strike Avoidance and Injured/Dead Aquatic Protected Species Reporting Protocols” address vessel strike prevention.

- (3) **Marine Trash and Debris** – During construction or operation activities, equipment may be dropped to the seafloor. If this happens within the planned construction site, the bottom disturbance impacts are conservatively considered as part of the routine impacts; however, accidental drops may occur during transport. The discharge of marine debris by the offshore oil and gas industry and supporting activities is subject to a number of laws and treaties. These include the Marine Debris Research, Prevention, and Reduction Act; the Marine Plastic Pollution Research and Control Act; and the International Convention for the Prevention of Pollution from Ships (MARPOL) Annex V Prevention of

Pollution by Garbage from Ships. Regulation and enforcement of these laws is conducted by a number of agencies such as the U.S. Environmental Protection Agency (USEPA), National Oceanic and Atmospheric Administration (NOAA), and U.S. Coast Guard (USCG). Requirements in the NMFS 2020 BO Appendix B: “Gulf of Mexico Marine Trash and Debris Awareness and Elimination Survey Protocols” address marine debris prevention.

- (4) **Entanglement/Entrapment** – Marine animals may become entangled or entrapped in facility (platform) or vessel moon pool, flexible lines, equipment, or gear used during construction, drilling, production/operation, and decommissioning activities. Lines in the water, moon pools, or accidental marine debris may pose an entanglement/entrapment risk. Entanglement and entrapment can lead to injury, infection, reduced mobility, increased susceptibility to predations, decreased feeding ability, fitness consequences (increased potential for vessel strike due to an inability to avoid), and/or mortality of marine wildlife. Requirements in the NMFS 2021 Amended ITS Slack-line Precautions COA, Moon Pool Monitoring COA, and Reporting Requirements COA address entanglement/entrapment prevention.

B LIST OF PREPARERS

Perry Boudreaux	Chief, Environmental Operations Section
Alicia Caporaso	Benthic Communities, Archaeological Resources; Benthic Ecology Lead
Bruce Cervini	NEPA; Senior Physical Scientist
Sindey Chaky	Environmental Justice and Human Uses; Senior Social Scientist
Nicole Charpentier	CZM; Environmental Protection Specialist
Annette Ehrhorn	NEPA; Senior Environmental Scientist
Tre Glenn	Marine Mammals, Sea Turtles, Protected Species Issues; Senior Protected Species Biologist
Jose Hernandez	Air and Water Quality; Physical Scientist
Andrea Heckman	NEPA; Environmental Scientist
Jack Irion	Supervisor, Social Sciences Unit
Quazi Islam	NEPA; Senior Physical Scientist
Douglas Jones	Archaeological Resources; Marine Archaeologist
Hayley Karrigan	Marine Mammals, Sea Turtles, Protected Species Issues; Protected Species Biologist
Jessica Mallindine	Marine Minerals; Marine Biologist
Denise G. Matherne	NEPA; Physical Scientist
Stacie Merritt	Air and Water Quality; Physical Scientist
Margaret Metcalf	Supervisor, Physical Sciences Unit
Deborah Miller	Technical Editor
Beth Nord	Marine Mammals, Sea Turtles, Protected Species Issues; Senior Protected Species Biologist
Cholena Ren	Air and Water Quality; Physical Scientist
Catherine Rosa	CZM; Environmental Assessment Specialist
Casey Rowe	NEPA; Senior Environmental Scientist
John Schiff	Air and Water Quality; Physical Scientist
Kate Segarra	Supervisor, Biological Sciences Unit
Scott Sorset	Archaeological Resources; Marine Archaeologist
Mariana Steen	Fish/Invertebrates and EFH; Marine Biologist
Sara Thompson	Senior Mission Analyst
Sarah Vaughn	Air and Water Quality; Physical Scientist
Jeri Wisman	Fish, Marine Mammals, Sea Turtles, Protected Species Issues; Marine Biologist
